

STATE OF CALIFORNIA  
MEETING OF THE  
CALIFORNIA INSPECTION & MAINTENANCE REVIEW  
COMMITTEE

Tuesday, January 24, 2006  
California Air Resources Board  
1001 I Street, Coastal Hearing Room  
Sacramento, California

1 **MEMBERS PRESENT:**

2 VICTOR WEISSER, Chairman

3 JUDE LAMARE

4 DENNIS DECOTA

5 JEFFREY WILLIAMS

6 ROGER NICKEY

7 BRUCE HOTCHKISS

8 ROBERT PEARMAN

9 PAUL ARNEY

10 JOHN HISSERICH

11  
12 **MEMBERS ABSENT:**

13 TYRONE BUCKLEY

14 GIDEON KRACOV

15 CHUCK FRYXELL

16  
17 **ALSO PRESENT:**

18 ROCKY CARLISLE, Executive Officer

19 JANET BAKER, Executive Assistant

20 STEVE GOULD, IMRC Consultant

**INDEX**

**PAGE**

Call to Order and Instructions . . . . .	3
Approval of Minutes . . . . .	5
Executive Officer's Activity Report . . . .	5
Review of the IMRC Mission Statement . . .	29
BAR Update . . . . .	31
ARB Update . . . . .	43
Presentation by Phil Heirigs . . . . .	63
Presentation by Dr. Jeffrey Williams . . .	96
Presentation by Mike McCarthy . . . . .	123
Legislative Update . . . . .	196
Public Comments . . . . .	203
Adjournment . . . . .	208
Transcriber's Certification . . . . .	209

P R O C E E D I N G S

CHAIR WEISSER: Okay, ladies and gentlemen, if I could ask you to take your seats, we will start the meeting. Good morning. For this, our first meeting of the IMRC in 2006, today is for the record, January 24<sup>th</sup>. I am Vic Weisser, the Chair of the IMRC, and looking forward to a productive year with my good friends here up at the podium and those of you in the audience. What we'll do is just do self-introductions so we get on the record the fact that we do have quorum and we'll start from my far right. There's a new bearded gentleman, as you can see, to my far right. Perhaps he could introduce himself.

MEMBER HOTCHKISS: Bruce Hotchkiss.

MEMBER DECOTA: Good morning. Dennis DeCota.

CHAIR WEISSER: Vic Weisser.

MEMBER WILLIAMS: Jeffrey Williams.

MEMBER HISSERICH: John Hisserich.

MEMBER NICKEY: Roger Nickey.

MEMBER LAMARE: And Jude Lamare.

CHAIR WEISSER: Excellent. I also will draw the audience notice to the strange man sitting in the box to my left, also bearded. I guess I didn't get the memo that the IMRC was going to become the House of David. Very good.

- o0o -

1 Well, the first order of business is the approval of the  
2 minutes from our last meeting that was November 22<sup>nd</sup>. I  
3 will ask if Committee Members have had a chance to review  
4 the minutes. Does anybody need some time to -

5 MEMBER HISSERICH: I have, I will move approval for the minutes.

6 CHAIR WEISSER: Okay, we have a motion for adoption or approval  
7 of the minutes from Mr. Hisserich. Is there a second? And  
8 Mr. Williams will second it. Is there any discussion?  
9 Hearing none, all in favor of adoption, please signify by  
10 saying aye.

11 ALL MEMBERS: Aye.

12 CHAIR WEISSER: Any opposed? Hearing none, the minutes are  
13 adopted as submitted. Thank you, very much, Rocky.

14 - o0o -

15 And now we move into our Executive Officer's Activity Report  
16 for the last two months. And Rocky, you're on.

17 MR. CARLISLE: Thank you, Mr. Chairman, Members of the  
18 Committee. First of all, in Tab 2, you have a number of  
19 handouts I put in there and I'll go through those kind of  
20 one at a time, but the first thing I wanted to talk about is  
21 the data information requests, data and/or information  
22 requests, we submitted to both ARB and the Bureau of  
23 Automotive Repair. I created a database so we could track  
24 these a little easier and I also created a tab, as you  
25 notice on that first one that shows a follow-up, so we put

1 in a request to the Bureau of Automotive Repair for a issue  
2 paper on the \$450 cost limit. I followed-up on that request  
3 on January 17<sup>th</sup>, and right now, it's my understanding that  
4 all the staff is engaged with the NGET implementation, so  
5 that is on hold. I haven't had a formal response yet as to  
6 that issue.

7 CHAIR WEISSER: Well, I'm sure that the Department, when they  
8 make their presentation to us, will give us some idea as to  
9 when we might expect that analysis to be completed. Please  
10 continue.

11 MEMBER LAMARE: Gentlemen.

12 CHAIR WEISSER: Ms. Lamare?

13 MEMBER LAMARE: Could you explain what NGET is?

14 MR. CARLISLE: NGET is the Next Generation Electronic  
15 Transmission. They have a new contractor that's taking care  
16 of the transmitting of the certificates and the test  
17 information to the vehicle information database. And so  
18 they have been working on that for some time. It's a rather  
19 large contract as far as money and it is consuming a lot of  
20 resources. The other -

21 CHAIR WEISSER: Excuse me, Rocky. Just for the record, we'll  
22 announce that Mr. Pearman has arrived. Please continue.

23 MR. CARLISLE: Okay. The other request was information  
24 regarding low pressure fuel evaporative implementation. The  
25 Air Resources Board sent BAR a letter in November requesting

1       that they expeditiously implement that program. I followed  
2       up on January 17<sup>th</sup> and same response. Another one -

3 CHAIR WEISSER: Excuse me. Once again, I'm hopeful that we'll  
4       be able to get a little more precise information regarding  
5       the status of that when the Department makes its  
6       presentation. Thank you.

7 MR. CARLISLE: Next one was with regard to BAR roadside  
8       inspections. I followed up on that on the 17<sup>th</sup> and again,  
9       they're working on that. And the last one was with regard  
10      to Consumer Assistance Repairs. I've requested the vehicle  
11      identification numbers for vehicles that were repaired under  
12      the CAP program. I don't want any of the consumer  
13      information, only the VINs, so we can do an analysis as we  
14      continue our comparison with test-only and test-and-repair  
15      and Gold Shield.

16 CHAIR WEISSER: And once again, I'm hopeful that the Department  
17      or the Bureau might be able to clarify a little further, a  
18      little more than status unknown when they chat with us.  
19      Thank you.

20 MR. CARLISLE: Request sent to the Air Resources Board with  
21      regard to Fuel Evaporative Testing on how many vehicles will  
22      be subject to the low pressure fuel evaporative test and how  
23      many vehicles were damaged. Sylvia Morrow did respond that  
24      in 2010 ARB estimates that there will be 5.7, actually 5.8  
25      million, pre-1966 vehicles and, of those, the test would be

1 applicable to half that population per year. And she is  
2 still looking into the damage issue. And the last request  
3 of the Air Resources Board was with regard to a list of  
4 contractors, the potential bidders for Sierra Research  
5 contract that was recently awarded, and in your binder you  
6 will find that list of contractors. Also I have in the next  
7 one - I've separated these, by the way, by the blue paper.  
8 There is a request from Assemblywoman Shirley Horton. She  
9 would like the Committee to quantify the air quality  
10 benefits associated with the direction of vehicles and I  
11 have been looking into that. My concern is that currently  
12 the only information we have readily available is the report  
13 that was recently released by BAR and ARB. The concern I  
14 have with that is based on 2002 data, so we're going to look  
15 at that and see if we can't maybe update that information.  
16 But this is in regard to AB578, the Gold Shield bill that  
17 would allow the Gold Shield CAP stations the first test of  
18 directed vehicles.

19 CHAIR WEISSER: Rocky, do you know why the Assemblywoman chose  
20 to contact us rather than BAR or ARB directly?

21 MR. CARLISLE: I do not.

22 CHAIR WEISSER: And I'm assuming in order to get any more recent  
23 data, you're going to have to go the Department and -

24 MR. CARLISLE: Yes, and actually we have five years' worth of  
25 data that Jeffrey has and he's been doing a considerable

1 amount of analysis on it. It's something that we're just  
2 going to have to look at and see if there's another way to  
3 go about quantifying the emissions reductions or the  
4 benefits of test-only. Because certainly, there is a  
5 difference between 2006 and 2002. Another letter I have  
6 included in there is a letter from -

7 CHAIR WEISSER: Excuse me, before you move on, I'm sorry, this  
8 is an item that obviously gets the attention of a lot of the  
9 stakeholders in the process and that leads me to believe  
10 we're faced with a somewhat of a logistic challenge. On the  
11 one hand, it would be really desirable to get back to the  
12 Assemblywoman as soon as possible in order for us to respond  
13 to her request for information. On the other hand, I'm sure  
14 that Members of the Committee would like to see the draft of  
15 our response prior to it going out. We're subject to all  
16 the acts associated with constraining bodies, such as  
17 ourselves, from meeting in private. Therefore, I'm asking  
18 you to figure out a way with our attorney that we can do a  
19 review of this letter as soon as the data is available, the  
20 initial draft is completed. It may, in fact, require us to  
21 have some sort of a phone conference call or something like  
22 that. Of course, I think it is important we try to respond  
23 as quickly as possible. Are there are any comments on the  
24 part of any of the Members of the Committee on this?

1 MEMBER DECOTA: Only the - Dennis DeCota, only to the point that  
2 this has also been directly asked of the agencies.

3 CHAIR WEISSER: Oh, I was not aware of that. Oh, great. Maybe  
4 we can get a sense from the agencies what their timeframe is  
5 for replying. Or maybe not.

6 CHAIR WEISSER: Please continue Rocky.

7 MR. CARLISLE: Okay. We also have received a copy of a letter  
8 from a number of organizations, primarily - it's addressed  
9 to the Governor from American Lung, NRDC, Union of Concerned  
10 Scientists, PCL, and the Sierra Club. It's with regard to  
11 implementing, again, the low pressure fuel evaporative test  
12 and the fact that that does provide a benefit of 14 tons per  
13 day by 2010. So they're urging the Governor to see that  
14 that gets implemented. And, again, a copy is in your  
15 binder. As far as other activity -

16 CHAIR WEISSER: One moment, Rocky. Dennis has a comment or  
17 question.

18 MEMBER DECOTA: As a member of the BAR Educational Advisory  
19 Committee, a very interesting presentation on evap was put  
20 on by Rick Escalambre of Skyline College and it might be  
21 timely in the next few meetings that Rick do a presentation  
22 of what he feels is - he's developed a curriculum, course to  
23 train industry on evap and the repair numbers that can be  
24 sought through these things - anticipated through these  
25 things are very exciting. I mean from the standpoint of

1 industry. Right. And it would be, I think, well worth the  
2 Committee's time to hear out Mr. Escalambre on this issue.

3 CHAIR WEISSER: Well, I'd be interested in that, Rocky, and  
4 perhaps he, as an educator, could also let us know how the  
5 industry might approach a smoke test, if the legislation  
6 that you'll be talking about shortly comes through. So, if  
7 Dennis, if we could ask you and Rocky to coordinate the  
8 timing of such a presentation, I'd like it to be made in the  
9 February meeting.

10 MEMBER DECOTA: I know that Mr. Escalambre is willing to do so.

11 All you need to do is write him, Rocky, and it will be done.

12 CHAIR WEISSER: And I don't know what he'll be able to offer in  
13 terms of the smoke test, but at least he could kind of  
14 educate us as to the process that we have to go through.  
15 Just for the record, I'll announce that Mr. Arney has  
16 arrived. Welcome, glad you had a safe journey.

17 MEMBER ARNEY: Thank you, Vic. I'm happy to be here.

18 CHAIR WEISSER: Rocky?

19 MR. CARLISLE: Okay. We've also continued our research on the  
20 Chairman's request to look into Safety Inspections. With  
21 regard to that, Dr. Gould looked up a Tire Pressure Study  
22 that was done by the National Highway Transportation and  
23 Safety Administration and he's done a significant amount of  
24 analysis extrapolating some of the data from that and trying  
25 to come up with a reasonable benefit, if you will, as a

1 result of simply testing tire pressure when the Smog Check  
2 is performed. The results, they don't have a lot of  
3 benefits. It does save a number of lives, but -

4 CHAIR WEISSER: Okay. Come on, that was a softball, folks.

5 MR. CARLISLE: It doesn't have a lot of emissions benefits, but  
6 it does save lives. He estimates it's four lives per year,  
7 which equates to about \$32 million dollars, because they  
8 assign about \$8 million dollars per life, which is amazing  
9 you can put a dollar value on a life, but they do. So we've  
10 got this document, I've included that in your handout, but  
11 we've also referred that to a couple of experts to see if we  
12 can get their input on it as well before we proceed and we  
13 can then maybe make a recommendation to the Bureau of  
14 Automotive Repair, maybe the Air Resources Board, that  
15 additional work be done on that because, like I say, the  
16 emissions benefits are limited.

17 CHAIR WEISSER: Which, I guess, is because the assumption is  
18 folks only check their tires once every two years.

19 MR. CARLISLE: Correct.

20 CHAIR WEISSER: Mr. DeCota?

21 MEMBER DECOTA: There is going to be I think some level of  
22 certification in training technicians on these new systems  
23 to diagnose tire pressures, okay, as they come onto the  
24 market. It would be interesting to see, Rocky, if we could  
25 take and put a number to the improvement on proper inflation

1       versus improper inflation on gasoline mileage that would  
2       take and be an air benefit number at the end. In other  
3       words, if the car increases its mileage by X, the emission  
4       reductions will be Y, and -

5 MR. CARLISLE: That's actually in this document.

6 CHAIR WEISSER: That's what they did.

7 MEMBER DECOTA: Okay.

8 MR. CARLISLE: There are a number of benefits. For example, it  
9       also reduces PM10, but the particulate matter, the PM10,  
10       doesn't appear to be as big an issue as the PM2.5 because  
11       any time you have low tire pressure, you have an increased  
12       rate of wear on the tire itself. That rubber gets  
13       transmitted into the air.

14 MEMBER DECOTA: It's just amazing that every morning you hear of  
15       the at least two or three rollover accidents on the freeways  
16       in just the Bay Area that I'm familiar with on the radio  
17       stations and to create a rollover accident, it used to be a  
18       very rare situation. Today, it's almost a daily common  
19       occurrence.

20 MR. CARLISLE: Right.

21 MEMBER DECOTA: And there is some value in looking at this and I  
22       don't know about the value of human life, but I don't know  
23       if \$8 million dollars would replace Vic, so that bothers me.

24 CHAIR WEISSER: I think there are going to be people standing in  
25       line to catch that figure.

1 MR. CARLISLE: In addition, we looked at a couple of other  
2 reports. Steve went to the - excuse me?

3 CHAIR WEISSER: Ms. Lamare?

4 MEMBER LAMARE: Thank you. Before you leave tire pressure, I  
5 would note that part of local education campaigns about  
6 ozone reduction is instruction to vehicle owners to maintain  
7 proper tire pressure and also, so it's not irrelevant to the  
8 air quality arena or unknown, although it's not clear how  
9 the Smog Check inspection might strengthen that kind of  
10 vehicle-owner awareness about the impacts of proper tire  
11 inflation, but I would also note given all the attention  
12 that we now have on climate change and ways to reduce fuel  
13 consumption, Dennis's comment about fuel consumption on  
14 under-inflated tired vehicles is very relevant to that  
15 discussion, so I'm sure maybe ARB would take our work on  
16 this and take it a little bit further and see how it fits  
17 into their program. Thank you.

18 CHAIR WEISSER: Excellent suggestion. Dennis?

19 MEMBER DECOTA: The correlation between possibly this type of  
20 program in evap could be interesting because evap, although  
21 we all know we're looking for VOC emission reductions with a  
22 proper sealed system, we also have a safety issue called  
23 fire and we have a lot of vehicles today, again, on the  
24 roadsides that are burning up. And the reason for that are  
25 these leaks. And I mean, it's almost something that we need

1 to think of in a little bit wider vision of having a safety  
2 program, I think, that is meaningful. So, maybe this is a  
3 step.

4 MR. CARLISLE: Well, one of the things you notice in the report  
5 that 27 percent of vehicles have at least one tire under-  
6 inflated by 25% percent of placard and placard is typically  
7 the stated pressure on the vehicles. So, it is a problem.  
8 Tires lose about one pound per month just normally from -  
9 just lost through the tire itself and they also lose one  
10 pound of pressure for every ten degrees decrease in  
11 temperature, so it can be significant when you're going from  
12 summer to winter.

13 CHAIR WEISSER: Roger?

14 MEMBER NICKEY: Just a comment. If we exempt the first six  
15 years on renewal and we exempt the first four years on  
16 transfer, that takes a lot of vehicles out of the mix. Then  
17 Smog Check is every other year. If we're gonna check tire  
18 pressure, it really ought to be on somebody that sees the  
19 vehicle more often, for instance, oil and filter change  
20 every three months, 3,000 miles. There's the place that  
21 should be doing it.

22 CHAIR WEISSER: Well I think that's well-taken. And I -

23 MEMBER NICKEY: I made him speechless?

24 CHAIR WEISSER: Yeah, no, I'm just - I'm trying to think how we  
25 can approach that in a way that we actually might get some

1 follow-through by both the dealerships and the repair shops  
2 that do see the cars more frequently. Fortunately, often  
3 more than 3,000 miles, but still more frequently. And  
4 perhaps what would be good to do is for us to chat with the  
5 organizations that represent those folks and see if there's  
6 some sort of approach that they might not be willing to  
7 engage in. Frankly, building upon the heightened public  
8 interests associated with greenhouse gases and with  
9 pollution, criteria pollution, we might be able to see if  
10 there's a public interest campaign that repair participants  
11 might be willing to engage in. You know, this is a public  
12 education issue in my mind. I remember several years ago  
13 trying to get the Department of Motor Vehicles to include an  
14 insert in vehicle license renewals to remind people to do  
15 certain sorts of safety-oriented repairs. But trying to get  
16 the DMV to include a slip of paper in their registration  
17 renewal notice is slightly more difficult than finding Osama  
18 bin Laden and I was unsuccessful. But perhaps working  
19 through the private sector, we might actually be able to  
20 accomplish something. So, Rocky, perhaps you and I and, we  
21 can initially start with Dennis, and then also chat with  
22 some of the representatives of dealerships to see whether  
23 there are any things that we might be able to come up.  
24 Anyhow, please proceed.

1 MR. CARLISLE: Okay. There was also another report, I've  
2 included two additional reports. Dr. Gould found one at the  
3 library. It was referred to as the Effectiveness of Vehicle  
4 Safety Inspections and in that they include that less than  
5 one percent of accidents are caused by lights, brakes or  
6 turn signals. The majority of accidents are caused by  
7 driver error.

8 CHAIR WEISSER: What does less than one percent translate into?  
9 I just saw a tire inflation thing that says we'll save four  
10 lives. What does less than one percent translate into in  
11 terms of the number of accidents in California that could be  
12 avoided?

13 MR. CARLISLE: I would have to look into that further, because I  
14 didn't apply that to California data.

15 MR. DECOTA: I believe there's - Mr. Chairman, I believe there's  
16 16 or 17 states that do have a vehicle safety program,  
17 annual program.

18 CHAIR WEISSER: Yes.

19 MR. DECOTA: Okay. And Maryland is - currently in their  
20 legislature to strengthen theirs. They do not have the  
21 statistical proof, okay, of the program's validity. But,  
22 they do have evidence and testimony that it does save lives  
23 and it does take and create less accidents to - I would be  
24 more than willing, Rocky, to give you Roy Littlefield's  
25 phone number, who is their executive director on their

1 program, because they're working on it quite vigorously  
2 right now to improve it. They already have one, but to  
3 improve it, so.

4 MR. CARLISLE: Okay.

5 MR. DECOTA: That might help.

6 MR. CARLISLE: There was another report, too, that - the first  
7 report was actually done in 1999. The second one I found on  
8 the Internet was done in 2002 and it was entitled The Policy  
9 and Effectiveness of Offsetting Behavior and Analysis of  
10 Vehicle Safety Inspections, so they both pretty much  
11 conclude the same thing, that they're not an effective  
12 means, if you will.

13 CHAIR WEISSER: Well, thank you. I'd like to read both of these  
14 and become more educated. I guess I'm reacting to some sort  
15 of intuitive sense that at least once every two years for  
16 older cars, it makes sense to make sure the lights are  
17 working, the brake lights function, the brakes function,  
18 windshield wipers work, tires have tread, those sorts of  
19 things. But, if there's already been analysis that shows  
20 that I'm wrong, that everybody keeps those in pretty damned  
21 good shape, then I will be educated. Jude?

22 MEMBER LAMARE: I prefer to sit next to you where I can you.

23 CHAIR WEISSER: Will you note that for the next meeting?

24 MEMBER LAMARE: That was a joke. I have not read these studies.

25 Looking at them very superficially, it would appear that

1 both of them are studies in which the State is the unit of  
2 analysis and I would be extremely cautious about making any  
3 interpretations from any statistical study where the State  
4 is the unit of analysis because the States are not  
5 distributed normally. They're very, very different from  
6 each other, they're not equivalent in any sense whatsoever  
7 and these are all statistical studies, as I understand it,  
8 using regression equations to interpret the results. And so  
9 I think we need to dig a little deeper. This will help us  
10 raise questions, provoke issues, things to think about and  
11 information to put in the mix, but I wouldn't take the  
12 conclusions of a regression analysis of States as deciding  
13 how we should come down on this issue. Thank you.

14 CHAIR WEISSER: Thank you, Jude. Rocky?

15 MR. CARLISLE: Okay. The next item, we're looking at vehicle  
16 registration information. This is part of our looking at  
17 program avoidance and recently Dr. Williams sent me a file  
18 containing approximately 13,000 delinquent registrations.  
19 These registrations were delinquent as of December of 2004.  
20 So, in January of '06, I sent that up to Teale to match them  
21 against the DMV records to see who had done what and when.  
22 Seven thousand of those were put into a P&O status, a  
23 deferred registration, non-operation.

24 CHAIR WEISSER: Could you give us that number again, 7,000 of  
25 how many?

1 MR. CARLISLE: Approximately 7,000. These are just -

2 CHAIR WEISSER: Out of how many?

3 MR. CARLISLE: Out of 13,000.

4 CHAIR WEISSER: Thank you.

5 MR. CARLISLE: The remainder had all come into compliance within  
6 about 13 months. Very few - I think there was only one I  
7 couldn't account for that hadn't been registered. Now, the  
8 other part of that is, of those that are P&O'd how many are  
9 actually on the roadway? We don't know the answer to that,  
10 so again, Dr. Gould has followed up with a parking lot  
11 survey. He went out several days and to date we have about  
12 100 delinquent registrations. I ran some of them last week,  
13 I ran some of them last night. I did get it back, there's  
14 only a couple that were actually - that were P&O'd, that  
15 were actually on the road. A lot of the ones in the parking  
16 lot appear to be, they just forgot to put the tags on it.  
17 Because, even though when he went out in the last week and  
18 they showed delinquent registrations, they were expired,  
19 they're currently registered according to DMV record. So,  
20 we haven't finished the analysis on this, but we're gonna  
21 expand that parking lot survey and possibly even go to other  
22 counties to get a representative sample, if you will.

23 CHAIR WEISSER: Excellent. I love the footwork.

24 MR. CARLISLE: Okay.

25 CHAIR WEISSER: How many of those cars were Randy Ward's?

1 MR. CARLISLE: Probably all of them. We're also - we finalized  
2 the preconditioning report. I did send everybody a draft a  
3 couple of weeks ago on that one and that will be in the  
4 final report - the draft report that I submit in the next 30  
5 to 60 days to the Committee. I've also been drafting an  
6 Executive Summary that would include the items that we  
7 researched and mentioned in the previous report to the  
8 legislature and the Governor and have yet to be implemented  
9 and so that's still in the drafting process. We've also  
10 continued the follow-up on other State data. We recently  
11 received a report from the Sierra Research Group and that's  
12 their annual evaluation of the Smog Check programs and I  
13 think overall, correct me if I'm wrong, Steve, I think  
14 California got a C+, was it, for our emissions program?

15 CHAIR WEISSER: Excuse me, from a C+ from whom?

16 MR. CARLISLE: From Sierra Research. They have a grading  
17 system, they grade all the states' programs. And if anybody  
18 wants to look at that -

19 CHAIR WEISSER: I would like to look at that.

20 MR. CARLISLE: I've got it right here.

21 CHAIR WEISSER: Thank you. I would like to take it.

22 MR. CARLISLE: Okay.

23 CHAIR WEISSER: I will get it back to you.

24 MR. CARLISLE: Great. It's the only copy I have.

25 CHAIR WEISSER: So Sierra Research grades people -

1 MR. CARLISLE: They grade the programs.

2 CHAIR WEISSER: - and they do that and then successfully win a  
3 contract for the next year. I'm impressed, I'm impressed.

4 MR. CARLISLE: I also reviewed the Request for Proposal for the  
5 new Referee contract. As you may be aware, that is a no-  
6 cost to the State type of contract and they recently had a  
7 bidders' conference on that. I did not attend it, but I  
8 understand there were a number of bidders. And essentially,  
9 the contract - currently the contract in round terms costs  
10 the State approximately \$6 million dollars as my  
11 understanding. The Referee did about 17,500 inspections.  
12 Now, if you take that out to the logical conclusion of how  
13 much per inspection, it works out to about \$340 per  
14 inspection. But there's a lot of other services that go  
15 into that that really isn't included in that \$340 per  
16 inspection. They take care of the call center to schedule  
17 those inspections, they have a significant number of  
18 cancellations they have to account for, they have to report  
19 to the Bureau of Automotive Repair, they also do research  
20 for the Engineering Division at the Bureau of Automotive  
21 Repair. For example, when fuel evap was being researched,  
22 they did a lot of the testing for that. When vehicles would  
23 fail on the roadside, they would go to the Referee to be  
24 tested again and then sent to the Air Resources Board for  
25 shed testing. So, there's a number of things that they do.

1 This RFP essentially suggests that they come up with a cost  
2 per inspection for the various types of inspections and that  
3 they will implement the contract based on that, essentially.  
4 So, for example, if you had an engine change, it might be a  
5 \$300 dollar inspection, who knows? But if you had a  
6 dispute, maybe it would be a \$50 dollar inspection. But,  
7 what becomes more problematic is, number one, if we  
8 implement - or if BAR implements Fuel Evaporative Testing,  
9 there could be dispute issues there. More importantly, if  
10 the legislature does, in fact, pass AB1870, which is a  
11 recent piece of the legislation that was introduced this  
12 last week that would provide a smoke test, then that would  
13 be the relief valve if the consumer objected, you know, or  
14 disputed the fact that they had a smoking vehicle. So, then  
15 what do you do with that vehicle? Does it go to the Referee  
16 and pay \$100, \$200, \$300 for an inspection? So there's a  
17 number of issues or problems that it could create at those  
18 types of costs.

19 CHAIR WEISSER: Are there any questions from Members of the  
20 Committee on that particular item? I'm very much interested  
21 in it because of the - I guess one of the issues I see is  
22 kind of the multiple benefits of having the community  
23 colleges involved in the program, both in terms of their  
24 credibility to the consumer and to the industry and the  
25 training that their participation in this program allows

1       them to provide to the technicians. So, I'll be kind of  
2       trying to keep my eyes on this one pretty carefully. When  
3       does the RFP call for the bids to be submitted by, Rocky?

4 MR. CARLISLE: The Intent to Bid letter is due on February 2<sup>nd</sup>,  
5       proposals are due on March 13<sup>th</sup>. The program has to be  
6       implemented by September 1<sup>st</sup>.

7 CHAIR WEISSER: When is the bidding process - who is doing the  
8       evaluation of the bids and when will that be accomplished?

9 MR. CARLISLE: Let's see -

10 CHAIR WEISSER: And if you're not certain, I'm sure that the  
11       Bureau might be able to help us.

12 MR. CARLISLE: No, I'm not certain, but the Notice of Intent to  
13       Award is gonna be done by March 30<sup>th</sup>, so that's in the  
14       document.

15 CHAIR WEISSER: I'd be real interested in hearing from the  
16       Bureau in terms of the process they're gonna be using for  
17       evaluating the bids. Did the RFP include the -

18 MR. CARLISLE: It has the proposal, yeah, it has all the  
19       methodology to evaluate the bids -

20 CHAIR WEISSER: Great.

21 MR. CARLISLE: - and it's quite extensive.

22 CHAIR WEISSER: Could you make copies of that and distribute it  
23       to the Members of the Committee, that portion of it?

24 MR. CARLISLE: Yes.

1 CHAIR WEISSER: And does it also describe then who is going to  
2 be involved in the evaluation process; is it going to be  
3 limited to BAR, is ARB involved or are there external,  
4 impartial -

5 MR. CARLISLE: It's gonna be a BAR evaluation team.

6 CHAIR WEISSER: Okay.

7 MR. CARLISLE: Okay.

8 CHAIR WEISSER: Comments? Anything further, Rocky, in your  
9 report?

10 MR. CARLISLE: Yes, as a matter of fact. On January 17<sup>th</sup>, the  
11 Automotive Business Coalition had invited me to Oroville to  
12 be a guest speaker at their meeting. They were very  
13 receptive to the research that the Committee is doing and  
14 they're gonna try to attend via the Internet. In February,  
15 I have scheduled a speaker from the Tool and Equipment  
16 Institute. This is our ongoing research on OBD II. The  
17 Tool and Equipment Institute has a number of pieces of  
18 equipment, or their manufacturer members have equipment,  
19 that is already being used for ODB-only testing around the  
20 country, so they're gonna talk about that. And finally, the  
21 next meeting on February 28<sup>th</sup> is gonna be in Emeryville and  
22 there's maps for locations on the back table and I think  
23 we've included maps for the Committee Members, so.

24 CHAIR WEISSER: That's at the City Hall -

25 MR. CARLISLE: Correct.

1 CHAIR WEISSER: - or that building just adjacent to the - oh, it  
2 is the City Hall -

3 MR. CARLISLE: City Hall, yes.

4 CHAIR WEISSER: - in the Counsel Chamber meeting room  
5 facilities. It's quite a nice place for those of you that  
6 haven't shown up before there.

7 MR. CARLISLE: And that concludes my presentation.

8 CHAIR WEISSER: Rocky - I mean - why do you let me do this -  
9 Dennis?

10 MEMBER DECOTA: As a Member that's been on the Committee for  
11 quite some time and had at least a couple of Executive  
12 Officers, I want to take and compliment you on your ability  
13 to put the information on paper, get it to us, give us the  
14 guidance that we have had as far as what progress has been  
15 made and the completeness of the job you're doing. I think  
16 you're doing an excellent job and your staff also, and I  
17 just, as one Member, want to say thank you.

18 MR. CARLISLE: Thank you.

19 CHAIR WEISSER: Should we take a vote on is Rocky doing a great  
20 job? I don't think it's really necessary. I think we're  
21 all, you know, have a great deal of appreciation for the  
22 work that you've done for the Committee over the time that  
23 you've worked with us and I'm looking forward to more. In  
24 that light, we will be giving you the bonus that's rewarded  
25 to outstanding State employees consistent with the entire

1 State compensation system and don't spend it all in once  
2 place, Rocky. Anything further?

3 MR. CARLISLE: No, that's it.

4 CHAIR WEISSER: Any questions of Rocky from any of the other  
5 Committee Members? We'll open it up then for some audience  
6 questions, if there are any, regarding just the  
7 presentations that Rocky has made. Are there any comments  
8 or questions? Mr. Peters?

9 MR. PETERS: Well, I could - I'm Charlie Peters, Clean Air  
10 Performance Professionals, coalition of motorists. I could  
11 probably stand up here and ask questions all day, but rather  
12 than go there, let me just ask one simple question. There  
13 was a survey done - there's indication of a survey done,  
14 looking at where these cars are coming from, where they're  
15 going to, whether - assuming whether or not they're getting  
16 Smog Checks, but what I found was interesting is what was  
17 not said. And that is I wonder if there's any tags on cars  
18 out there showing that they've been registered or they're  
19 registered in areas whose zip code doesn't require a Smog  
20 Check. And what I just said was tags on cars that don't  
21 belong on that car, so I think you have to do a survey that  
22 includes all the cars and verify the tag numbers and so on  
23 and research all that data to get any meaningful appropriate  
24 information as to what's going on in the fleet. Thank you.

1 CHAIR WEISSER: Thank you, Mr. Peters. Are there any other  
2 comments, please?

3 MR. CONWAY: Good morning. John Conway, Menlo Park Chevron. I  
4 was very interested in Rocky's report about air pressure.  
5 As a shop owner in the State of California, every lube, oil,  
6 and filter that comes through, we do check the tire  
7 pressure, so. We also perform a 25-point safety inspection  
8 and I think with what's going on in the automotive repair  
9 industry, it would be nice to charge for that safety  
10 inspection that we do at the service station or at the oil  
11 changing facilities in the State as an additional revenue  
12 stream to shop owners in the State, so I think that might be  
13 something to consider. A new revenue stream for shop  
14 owners, we could sure use the income.

15 CHAIR WEISSER: Thank you. Dennis, you might want to stay up  
16 here for a minute.

17 MEMBER DECOTA: Mr. Conway, for the Board's information is now  
18 (unclear) new president as of last week, so he's my boss so,  
19 just so the Committee knows and realizes that, I think it's  
20 important. Thank you, John.

21 MR. CONWAY: Thank you.

22 CHAIR WEISSER: Thank you. Thank you for your disclosure,  
23 Dennis. I am grateful for the stations that do safety  
24 inspections as a matter of routine when cars are brought in.  
25 I don't believe it's within this Committee's authority or

1 interest to necessarily try to set up revenue streams for  
2 the industry. You're in a competitive business. What it  
3 would - what I would like to explore is the notion of trying  
4 to provide some advantage for those people who are doing  
5 those sorts of inspections and I'm wondering that hopefully  
6 the conversations we have with you and folks from  
7 dealerships might be able to uncover some promotional  
8 advantages that might be made - that might be helpful.  
9 Whether or not you're able to use that to build a new income  
10 stream or enhanced income stream, I have no idea and I'm not  
11 sure it's this Committee's purview to really get involved in  
12 that. Though I understand the kind of the pickle that many  
13 members of the industry have found themselves in. Are there  
14 other comments from the public? Very good.

15 - o0o -

16 Hearing none, I notice the next item, Rocky, is the review  
17 of the IMRC Mission Statement. Is that included in our  
18 binder, because I didn't see it?

19 MR. CARLISLE: No, I didn't include that. I - we had originally  
20 put it on the Agenda because we thought that Chuck Fryxell  
21 was gonna be here and so we'd discuss that with the new  
22 Committee Person.

23 CHAIR WEISSER: Okay. Now, Committee Member Fryxell has been  
24 unable to participate in our sessions yet and we've had some  
25 contact with him. It's uncertain as to precisely when he

1 will start and I think, frankly, you know, we ought to just  
2 put this thing to bed. We have a Mission Statement. Those  
3 of you who were with us last meeting in November reviewed  
4 it. The discussions and comments that we heard previously  
5 and at that meeting were that the Members of the Committee  
6 were comfortable with it. You don't happen to carry it with  
7 you in your pocket, do you Rocky?

8 MR. CARLISLE: No, but I can pull it up on the website.

9 CHAIR WEISSER: Pull it up on the website, if you can and we'll  
10 do a quick read-through, in which time we'll just see if  
11 there, in fact, the Mission Statement does still enjoy the  
12 support of the Committee Members and then we can move  
13 forward.

14 MR. CARLISLE: You should have it.

15 CHAIR WEISSER: Okay. So let's - so the audience can see this,  
16 I'm gonna read it through in blitzkrieg fashion. The IMRC  
17 is an advisory body established to review and evaluate the  
18 vehicle inspection and maintenance program and to recommend  
19 program improvements to the Administration and the  
20 legislature in a timely manner. The goals of the IMRC are  
21 to report to the Administration and the legislature on  
22 program performance and to identify and recommend methods to  
23 ensure that the program is effective in achieving emission  
24 reductions needed to meet clean air standards, efficient in  
25 terms of achieving emission reductions with the least

1 possible cost to individual participants and society as a  
2 whole and equitable in terms of the allocation of these  
3 costs, and, lastly, fair to stakeholders including  
4 motorists, vehicle inspection and repair service providers  
5 as well as to the public at large. So that constitutes the  
6 Mission Statement that we adopted when I first came on board  
7 the Committee, how many - that was three years ago - I  
8 really don't remember when I came, I'm having so much fun -  
9 when I came on board. Does any Member feel or believe that  
10 it would be desirable to make a change or improvement to  
11 this or is it okay? Can we have a motion to readopt  
12 unchanged the Mission Statement. And Ms. Lamare makes that  
13 motion. Is there a second to that motion? Mr. DeCota makes  
14 that second. Is there a discussion among Committee Members  
15 to that motion? Is there any comment from the public on the  
16 Mission Statement that I just raced through? Seeing none,  
17 we will then come to a vote. All in favor of the re-  
18 adoption without change of our Mission Statement, please  
19 signify by saying aye. Any opposed please signify by saying  
20 no. Hearing none, the motion carries unanimously.

21 - o0o -

22 We'll move on then, to our next item of activity, the BAR  
23 Update. Welcome to the IMRC for 2006. It's great seeing  
24 you guys, look forward to a very productive year.

1 MR. GUNN: Good morning. Marty Gunn with the Bureau of  
2 Automotive Repair. Back in December 15<sup>th</sup>, the Bureau of  
3 Automotive Repair received a written request for information  
4 from this Committee on four topics. The Bureau will be  
5 providing the Committee with a written response to these  
6 four requests, but I'll attempt to at least give you a  
7 preliminary address today. Issue No. 1 is the Chair of the  
8 Committee requested an Issue Paper addressing the \$450  
9 repair cost limit. At this time, BAR does not have the  
10 resources to dedicate staff to the tracking of this  
11 relatively small number of vehicles. The workload of  
12 manually - the paper that was requested would require some  
13 manual review of 1,200 plus vehicles, so the workload of  
14 manually reviewing an individually - each vehicle's repair  
15 invoice in order to answer this question would be very  
16 resource intensive and we don't have the resources at this  
17 time.

18 CHAIR WEISSER: Excuse me, if a legislator chose to introduce a  
19 measure to adjust this according to inflation since the last  
20 time it was adjusted, which - oh, was never, would the  
21 Bureau oppose or support that measure?

22 MR. GUNN: I don't know. I would suppose it would depend on the  
23 review of whatever is proposed by the legislature and the  
24 context in which it's proposed.  
25

1 CHAIR WEISSER: What if they just said we're gonna do it. I  
2 mean, times have changed. It's eight - X number of years  
3 passed, we ought to adjust it by CPI or something?

4 MR. GUNN: Again, I personally don't know, but I think the  
5 legislature can do that.

6 CHAIR WEISSER: Oh, I'm sure the legislature could do it, I'm  
7 just curious as to whether the Bureau would be supportive or  
8 not. I'll ask the same question of ARB when it's their turn  
9 to come up. Thank you. Dennis, you had a question on that?

10 MEMBER DECOTA: How can this Committee do it's job, Mr.  
11 Chairman, if - that it's supposed to do under legislative  
12 direction if we can't get the information we need to make  
13 recommendations?

14 CHAIR WEISSER: Well, it makes the job a little more  
15 challenging, obviously, but listen, I have great respect for  
16 the management and the staff of the Bureau. They need to  
17 make decisions associated with what they believe their  
18 priorities are. When they are unable to do analysis as, in  
19 this case, because the priorities are such that staff are  
20 being dedicated to other things, then we and other decision-  
21 makers have to move forward without the benefit of the data  
22 and merely rest our judgments on judgment.

23 MEMBER DECOTA: Thank you.

24 CHAIR WEISSER: And I'm - in the absence of data, it's my  
25 judgment that it would serve the State well to adjust that

1 repair cost limit. Having seen no data to assert that it  
2 was not a reasonable idea, I'd say it would be interesting  
3 to find the legislator that might be interested in attacking  
4 that issue. Mr. Hisserich?

5 MEMBER HISSERICH: Question, I note in each of the instances in  
6 which a request was made, it was deferred because the BAR is  
7 working to implement the NGET. How much of the efforts of  
8 the BAR is that NGET taking? I mean, it seems as though  
9 everything is on hold to implement that. Could you - in  
10 relative to the total effort there, is this like all  
11 consuming?

12 MR. GUNN: No. BAR's a busy place.

13 MEMBER HISSERICH: I see.

14 MR. GUNN: We do a lot of different functions and no doubt about  
15 it, NGET does take a lot of resources, but particularly  
16 resources in the area of being able to do analysis of data  
17 and that sort of thing, is that why it seems to - because I  
18 think most of these were data requests, if I'm not mistaken.  
19 Yeah, and unfortunately I'm probably not the best person to  
20 ask regarding prioritizing everything the Bureau has to do  
21 when allocating all the resources. I'm not the chief of the  
22 Bureau of Automotive Repair, but I would imagine that in  
23 reviewing this request in context with everything else the  
24 Bureau has to do, including NGET, that it just wasn't  
25 feasible to do at this time.

1 CHAIR WEISSER: Please continue.

2 MR. GUNN: Okay. Item No. 2, the Committee requested an update  
3 on the implementation of low pressure fuel evaporative  
4 testing. And this is somewhat involved, so I'll try to read  
5 this. BAR has been working with the Air Resources Board to  
6 develop a process to conduct low pressure evaporative  
7 testing. Each agency has its role in identifying and  
8 validating issues and solutions in the process of  
9 implementing this new smog emissions test. In November  
10 2005, ARB provided findings to BAR as to it's validation of  
11 a process of testing. In response, BAR started an internal  
12 working group to do three things: one, identify topics,  
13 issues, and processes to formulate necessary information to  
14 proceed with the implementation through regulatory -  
15 regulation process; secondly, assemble all known related  
16 evap emissions data; and finally, coordinate a timeline of  
17 principle steps for action to implement. Issues that are  
18 being identified as being researched and, if problematic,  
19 mitigation activities are being proposed and initiated. A  
20 principle step will be industry workshops that will help  
21 receive and address new questions and concerns in advance of  
22 the formal regulation hearing process. The workshop is not  
23 a formal component of regulatory hearings and allows freedom  
24 of interchange and discussion useful to pre-regulation  
25

1 writing. BAR expects these workshops North and South, to be  
2 completed by April of 2006.

3 CHAIR WEISSER: So the workshops will be completed by April and  
4 then based upon the information that's garnered in the  
5 workshops, what's the next step?

6 MR. GUNN: I believe the workshops are looking for the workshops  
7 for the technical data from responses to everybody to help  
8 write the regulations, so I imagine at that point, the  
9 regulations will be written or some type of draft will be  
10 composed and submitted for the regulation process through  
11 the APA, the Administrative Procedures Act.

12 CHAIR WEISSER: And do you have any sense of that timeline, what  
13 that might be, how long it will take to draft the  
14 regulations?

15 MR. GUNN: No, I - that's a great question, how long regulations  
16 take. I think the regulation procedure takes about a year,  
17 but, you know, I don't have a crystal ball.

18 CHAIR WEISSER: Are there any comments or questions on this  
19 item? Well, I have a comment, and that is on the one hand,  
20 I want you to do the most thorough job that you can, make  
21 sure that the situation is approached with a rational and  
22 thoughtful - in a rational and thoughtful manner. On the  
23 other hand, I want the darn thing adopted yesterday and this  
24 Committee has, as has the Air Resources Board, has been  
25 kinda pushing on this for a while. So, with that mixed

1 series of directions, you know, please proceed with all  
2 deliberate speed, I think the Supreme Court once used on an  
3 issue more important than this, but we're gonna be tracking  
4 this closely and we're very much interested in seeing it  
5 move forward. Thank you. Move on.

6 MR. GUNN: Issue No. 3, is BAR continuing to collect roadside  
7 emission data? Yes, we do, we are. We have roadsides going  
8 at this time.

9 CHAIR WEISSER: Cool.

10 MR. GUNN: And fourth, the Committee is requesting BAR provide  
11 vehicle identification numbers for all vehicles  
12 participating in CAP, both repair assistance and vehicle  
13 retirement. BAR is awaiting a legal review of the State of  
14 California Privacy Act and we are unable at this time to  
15 fulfill this request. However, BAR would like to know what  
16 this data will be used for because we potentially have it  
17 sitting on the shelf. So if you can tell us specifically  
18 what you want, then perhaps we can speed up this process and  
19 facilitate your request. Otherwise, we're waiting to hear  
20 from legal.

21 CHAIR WEISSER: I noticed that this request was, I think, made  
22 in November of 2005 and there's been ample time for that  
23 sort of question to be asked informally through Rocky or  
24 answered when Rocky called up and ask what the status is, so  
25 I'm kind of confused a little bit by, you know, your

1 response. Is that something that you've already  
2 communicated to Rocky?

3 MR. GUNN: Not that I have, no, sir.

4 CHAIR WEISSER: Rocky, kind of -

5 MR. CARLISLE: Yeah, the reason we want the data, we want to be  
6 able to pull those - those tests and repairs conducted by  
7 Gold Shield stations specifically on CAP repairs and see if  
8 we can do an analysis on the repair effectiveness of test-  
9 only versus test-and-repair. I'm sorry, versus Gold Shield  
10 versus test-and-repair and some of these other issues we've  
11 been looking at for the comparison of station types. And  
12 without those VINs, we've got no way to identify which  
13 repairs were done under the CAP Program. We can identify  
14 which repairs were done at a CAP station, but on the VIN, it  
15 doesn't identify which were done under the CAP Program, per  
16 se.

17 CHAIR WEISSER: Rocky, when you make a request of BAR, don't you  
18 include why you're making the request, what your - the  
19 reason that you're making the request and -

20 MR. CARLISLE: I believe here it was -

21 CHAIR WEISSER: And if - if -

22 MR. CARLISLE: - to continue to perform an important function  
23 relative to low-income repairs in effort to improve our  
24 research, we would like to request the VIN of both scrap  
25 vehicles and CAP-repaired vehicles.

1 CHAIR WEISSER: Well, it might be better in the future, and I'll  
2 take this as a lesson to be learned, if we are as explicit  
3 as possible as to how we're going to be using the data. I  
4 think it would also be really desirable to pick up a  
5 telephone and communicate when an issue like this arises.  
6 It's something that we could have saved, you know, a month  
7 and a half on, in terms of getting the information that you  
8 need in order to determine whether you have the data on hand  
9 or whether in fact, you're gonna have to go forward with  
10 some mysterious legal opinion regarding privacy issues. So,  
11 I think we both have something to learn from this particular  
12 data request. Jude?

13 MEMBER LAMARE: Mr. Chairman, I agree. I think it would be  
14 helpful to all of us to have a written understanding of what  
15 we want to do with the data. And it seems to me that this  
16 is a small sub-sample, it's not a random sample of repaired  
17 vehicles, but it's a small sub-sample over which we know a  
18 lot more and where the repairs are done under the direction  
19 of the State and with consultation with the State and so it  
20 represents a subset of vehicle tests and repairs where we  
21 could make a comparison and it provides us with a different  
22 level of understanding of what's going on with the  
23 comparison on test-and-repair and test-only stations. So,  
24 it wouldn't necessarily be obvious to the Bureau why we  
25 would want to do this and I think there's a certain amount

1 of sensitivity about the CAP program since this Committee  
2 has already raised a number of issues about how little  
3 people use the CAP program and what appears to be the uneven  
4 availability of that program in certain regions of the  
5 State. Thank you.

6 CHAIR WEISSER: Thank you. Rocky, did you have something to add  
7 to that?

8 MR. CARLISLE: Yes, Mr. Chairman. The other issue is we want to  
9 look at the durability of the repairs at CAP versus test-  
10 and-repair because the CAP repairs are on average, about  
11 double what the average test-and-repair repair is and,  
12 consequently, we'd like to see if they're more durable as a  
13 result. So, again, without that data, we're -

14 CHAIR WEISSER: Well, and all I'm suggesting in terms of take  
15 away messages is that when we ask for something, it would be  
16 very helpful for the Bureau, as well as others -

17 MR. CARLISLE: Absolutely.

18 CHAIR WEISSER: - to have a very explicit idea of why we're  
19 asking for it and what we plan to do with it, as it would  
20 have been very helpful had the Bureau called you up and  
21 said, why are you asking for this data, how - what are you  
22 gonna do. Okay.

23 MEMBER DECOTA: I have a question.

24 CHAIR WEISSER: Yes, Mr. DeCota?

1 MEMBER DECOTA: Rocky, are we asking BAR for information  
2 regarding 14B - as in boy? Are there any questions in the  
3 hopper to BAR or ARB regarding Agenda number - topic No.  
4 14D? I thought there was, but I don't see them in this and  
5 maybe they don't belong in here.

6 MR. CARLISLE: No, we've got all that data. We have all the VID  
7 data.

8 MEMBER DECOTA: Okay.

9 MR. CARLISLE: We've got that since 2000.

10 MEMBER DECOTA: We're not - we don't have any questions?

11 MR. CARLISLE: No.

12 MEMBER DECOTA: Okay.

13 CHAIR WEISSER: Okay. Is there anything further, other issues  
14 that you'd like to alert us to, things that are going on  
15 that the Committee might be interested in knowing about,  
16 things that we might be able to be helpful to you about?

17 MR. GUNN: You got me on the spot. Nothing comes to mind right  
18 now.

19 CHAIR WEISSER: Okay. Cool. Thank you very much.

20 MR. GUNN: Thank you.

21 CHAIR WEISSER: I guess we have to allow public comment on each  
22 and every item, so from now, I'd like you to consolidate  
23 these two items so we'll be able to do that more  
24 efficiently. Okay. So are there any comments from the  
25 public regarding this latest report? Mr. Peters?

1 MR. PETERS: I'm Charlie Peters, Clean Air Performance  
2 Professionals, a coalition of motorists. I'm a bit  
3 confused. It certainly seems to me as though we seem to be  
4 headed down a trail here that seems to be very interested in  
5 going in a specific direction. As an example, the issue of  
6 the \$450 cost limit that was just mentioned participating  
7 all the way back to 1990 and the process that took place  
8 between California and Federal EPA, etcetera, the opinions  
9 there were that there was an absolute legal requirement,  
10 completely nonnegotiable, that the Clean Air Act Amendments  
11 of 1990 required a specific cost limit and specific  
12 escalation and that was not negotiable, period. So, if  
13 we're gonna have to have all kinds of studies and  
14 evaluations and so on, if in fact what they said was  
15 correct, maybe the Committee ought to look at that rather  
16 than trying to slam BAR. Item 2, the fuel evap  
17 implementation issue, I have certainly provided my opinion  
18 to the Committee on numerous occasions which is certainly a  
19 matter of record. The issue of the Gold Shield and this  
20 compare - this data as to the performance of the Gold Shield  
21 or test-and-repair, test-only, unless there is some sort of  
22 evaluation whether or not what's broken is getting fixed and  
23 some sort of a comprehensive evaluation that is not  
24 comparing apples and oranges, I don't see what the data that  
25 you're asking for would accomplish, because the cars going

1 to different stations meet different criteria. You have  
2 completely different environment in those stations,  
3 different reasons for doing things, so unless you do some  
4 comprehensive evaluation as to whether or not something  
5 that's broken is getting fixed, whether or not something's  
6 actually getting accomplished or not in the real world with  
7 real people and real cars, I don't see that that does  
8 anything other than provide whatever data that you want to  
9 go where you'd like to go predetermined and I think it's  
10 appropriate to look at that in a more comprehensive fashion,  
11 Mr. Chairman and Committee.

12 CHAIR WEISSER: Thank you Mr. Peters. Are there any other  
13 comments from the public? Hearing none, we'll move on to  
14 our next item, which is a presentation from the Air  
15 Resources Board.

16 - oOo -

17 MS. MORROW: Good morning. I'm Sylvia Morrow with the  
18 California Air Resources Board and I'll go ahead and provide  
19 a little bit of an update, before I go into the  
20 presentation, that you might be interested in. First of  
21 all, Governor Schwarzenegger appointed a chairman to the Air  
22 Resources Board. His name is Dr. Robert Sawyer and we're  
23 very happy to have him so I thought I'd bring that. Also -

24 CHAIR WEISSER: Well, I just would like to interrupt you right  
25 there. I've met with Mr. Sawyer - Dr. Sawyer prior to his

1 appointment and I think the State of California is extremely  
2 fortunate to have been able to identify and appoint a person  
3 with his background, experience, interpersonal skills, and  
4 ethics to this job. I am jealous that you get to work for  
5 him. He seems like a pretty decent guy.

6 MS. MORROW: Also, I'd like to report that ARB/BAR Smog Check  
7 Report was approved by release by the Governor's Office and  
8 transmitted to the legislature and ARB did provide the IMRC  
9 with that notification.

10 CHAIR WEISSER: Sylvia, if I might, could you remind me, that  
11 report was for what year?

12 MS. MORROW: It was the April 2004 report, however, it was  
13 amended in 2005 to reflect things that had happened during  
14 the -

15 CHAIR WEISSER: The legis -

16 MS. MORROW: - public process of the report.

17 CHAIR WEISSER: Right. And when is - what's your next report  
18 cycle?

19 MS. MORROW: I'd have to check back on that. I don't have it  
20 off the top of my head.

21 CHAIR WEISSER: Would you do that and let Rocky know and he can  
22 email us and let us know what your cycle is?

23 MS. MORROW: Okay.

24 CHAIR WEISSER: Thank you.

1 MS. MORROW: Also, as you're aware, ARB did transmit a low  
2 pressure evap report to BAR in which ARB urges BAR to  
3 implement the test, so we did accomplish that task. In one  
4 of your previous questions today, you had asked if ARB had  
5 responded to, I believe Assemblywoman Horton, in regards to  
6 the information that she had asked from the IMRC Committee.  
7 I contacted our leg office and she has not requested that  
8 type of information from ARB.

9 CHAIR WEISSER: So she's just requested it from the IMRC?

10 MS. MORROW: That's correct.

11 CHAIR WEISSER: And BAR or not BAR?

12 MS. MORROW: I do not know about BAR, but she has not requested  
13 that information from ARB.

14 CHAIR WEISSER: Okay. Thank you.

15 MS. MORROW: Okay. In regards to the waiver issue, we believe  
16 that if a waiver amount is raised and more repairs are made,  
17 ARB thinks it would be good for the environment, so we would  
18 support something like that.

19 CHAIR WEISSER: Well, you know, this Committee doesn't per se  
20 sponsor legislation. But there are organizations that are  
21 represented on this Committee that - that do and I'm  
22 wondering whether or not ARB would be - would consider  
23 working with those organizations - one or more of those  
24 organizations in identifying a legislator that might be  
25 interested in sponsoring such a measure.

1 MS. MORROW: Okay. I'd have to contact our leg office.

2 CHAIR WEISSER: Sure. Could you check it out and see if there's  
3 an opportunity and I'll check out with other Members of the  
4 Committee to see whether there's other organizations that  
5 might be interested in pushing that idea.

6 MS. MORROW: Okay. And then, finally before I go into the next  
7 task, I do apologize for not providing the IMRC with the  
8 information regarding if there was damage due to low  
9 pressure testing that was done in El Monte and I will make  
10 sure that by the next meeting I do have that information  
11 available to you.

12 CHAIR WEISSER: Thank you, Sylvia. Are there any questions of  
13 Sylvia by any Members of the Committee? Thank you. Are  
14 there any comments from the public regarding the ARB's  
15 report?

16 MS. MORROW: I still need to -

17 CHAIR WEISSER: Whoops. Okay. Any comments from the public  
18 regarding this portion of the ARB's report? Hearing none.

19 MS. MORROW: Okay. I'll just give a little pre - before I start  
20 into the presentation. As you know, ARB and BAR contracted  
21 with Sierra Research to develop a Smog Check Evaluation  
22 Plan. First Sierra, ARB and BAR reviewed the Smog Check  
23 Program pathways to identify potential issues that should be  
24 evaluated. For each issue, Sierra, ARB, and BAR looked at  
25 specific questions that could be answered regarding the

1 issue, the potential emissions impact, potential analytical  
2 tasks, potential data resources, and estimated cost for  
3 analysis. The draft potential areas of analysis table that  
4 Sierra, ARB, and BAR developed is on the back table and each  
5 of the Committee Members should have a copy of it right now.  
6 ARB and BAR would like the IMRC and the public to review the  
7 table for completeness. If there are issues that are not  
8 addressed in the table or if you have comments on the  
9 contents of the table, we urge members of the public and the  
10 IMRC to provide written comments to the IMRC in writing  
11 prior to the next - the February IMRC meeting. So right now  
12 I'll go ahead and go through just a general description of  
13 the analysis plan. Oops. Okay. First of all, task one of  
14 the project called for development of a plan to improve the  
15 emission reduction capability of the Smog Check Program -  
16 oops, sorry. How do I go back? Okay. The plan has been  
17 broken down into two primary components. One, analytical  
18 tasks and two, the development of recommendations for  
19 testing. So Sierra, in consultation with ARB and BAR, have  
20 developed a draft list of analytical tasks. It is  
21 anticipated that test program recommendations will be  
22 formulated as the analytical tasks are completed. Issues to  
23 investigate - these are the issues that are listed on the  
24 table and these are the issues that we would like comments  
25 from the IMRC and the public and if there are any additional

1 issues. First of all, what happens to initial test failures  
2 that do not complete the Smog Check requirements, ie; a car  
3 fails a Smog Check Program and then is never subsequently  
4 registered in California. There's a lot of questions and if  
5 you look at the table that discuss, well, what happens with  
6 those cars. Are vehicles being tested with TSM when ASM is  
7 required? Do vehicles change test type in midstream? And  
8 the TSI is the two-speed idle test that it was required in  
9 the basic program areas and a two-speed idle test is  
10 required many times when a vehicle is not capable of being  
11 driven on the dyno. Are test aborts being used to influence  
12 the test outcome? Which stations and station types deliver  
13 the best performance in terms of identifying high-emitting,  
14 tampered, or defective vehicles, or the worst performance?

15 CHAIR WEISSER: May I interrupt you here?

16 MS. MORROW: Sure.

17 CHAIR WEISSER: Your - those are three specific types of  
18 vehicles; high-emitting, tampered or defective.

19 MS. MORROW: Yes.

20 CHAIR WEISSER: Or are you considering all of that one?

21 MS. MORROW: Well, we're just looking at that as, you know,  
22 that's just a summary of one analytical task. It could be  
23 that many types of data sources would be used to get out -  
24 get at that information. Okay. Which stations and station  
25 types deliver the best performance in terms of after-repair

1 emission rates, both immediately after repair and during  
2 subsequent cycles? Why is a large fraction of vehicles that  
3 fail and go on to receive a Smog Check Certificate failing  
4 at the roadside within a year? What is the emission impact  
5 of improper testing and/or certification activity? And, is  
6 there any way to encourage or offer incentives for more  
7 thorough and effective repairs?

8 CHAIR WEISSER: Could you go back to that what is the emissions  
9 impact of improper testing?

10 MS. MORROW: That's correct.

11 CHAIR WEISSER: What - could you be a little more explicit? I  
12 mean, are you trying - what are you trying to find here and  
13 what - how are you going -

14 MS. MORROW: Well, we're trying to find is are cars being clean-  
15 screened, which, you know, they're not actually getting the  
16 test, but it's a fraudulent activity -

17 CHAIR WEISSER: How are you going to find that out?

18 MS. MORROW: Well, and that's part of, you know, there are some  
19 data sources that are listed on the table that we could use  
20 to take a look at those kind of activities and determine  
21 what the emissions impact would be.

22 CHAIR WEISSER: Okay. Thank you.

23 MS. MORROW: So this will be our approach. Many questions can  
24 be addressed fully, or at least partially, by analysis of  
25 existing data. And we have identified the data in the

1 table. Analysis will also identify if new data or  
2 information are needed to fully address the question. Our  
3 next steps; once we receive the comments from the public and  
4 the IMRC, we will prioritize the analysis efforts with BAR,  
5 ARB direction, and with IMRC input. The timeframe, well  
6 right now we are expecting that comments will be provided by  
7 the next IMRC meeting, so probably right after the next IMRC  
8 meeting we will start looking at what the comments were and  
9 prioritizing the task. And then work will begin on each  
10 task after consultation with ARB. Sierra will work on each  
11 task after consultation with ARB and BAR. And that's it.

12 CHAIR WEISSER: Wow. Are there representatives from Sierra here  
13 today?

14 MS. MORROW: Yes, there is.

15 CHAIR WEISSER: Okay. What's the best way for people, including  
16 this Committee, to communicate to provide you input to  
17 respond to the questions that you've asked them to respond  
18 to?

19 MS. MORROW: Well, I contacted Rocky Carlisle this week and  
20 asked him if we would be able to use the IMRC email and for  
21 the IMRC to take the written comments and he was okay with  
22 that. So we would like the general public to provide their  
23 comments to the IMRC Committee in writing or via email so  
24 that we can fully understand them.

1 CHAIR WEISSER: How much are we charging ARB for this work,  
2 Rocky?

3 MR. CARLISLE: It remains to be seen.

4 CHAIR WEISSER: Okay.

5 MS. MORROW: Isn't is part of our in-kind?

6 CHAIR WEISSER: John?

7 MEMBER HISSERICH: Will any of the - will the use of this data  
8 require this analysis by the Attorney General about the  
9 privacy considerations that were raised when the previous  
10 ones came up?

11 MS. MORROW: I'm not aware if it would.

12 MEMBER HISSERICH: I mean, I just wonder because it - there is a  
13 proprietary organization gonna receive the information and  
14 some of this seems- I mean, I'm all for doing the analysis,  
15 but I'm just wondering if that issue being addressed in  
16 relation to our request might also be sort of dealt with to  
17 get that issue clarified before this all goes forward.

18 MS. MORROW: Yeah, go ahead. This is Phil Heirigs with Sierra  
19 Research.

20 MR. HEIRIGS: I'm with Sierra Research, Phil Heirigs. Good  
21 morning. This is the first time I've been to one of these  
22 meetings, so I appreciate the opportunity. In terms of the  
23 VINS and those issues, in the past what we have done is is  
24 signed confidentiality agreements that the data would sort  
25 of remain in-house and not to be distributed to any - any

1 outside agencies. So, typically in the past, we've dealt  
2 with those kinds of issues through fairly detailed and  
3 precise confidentiality agreements.

4 CHAIR WEISSER: I think the IMRC would be willing to sign any  
5 confidentiality agreements that BAR needs in order to be  
6 sharing of data. Rocky, would you follow up with that?

7 MR. CARLISLE: I will.

8 CHAIR WEISSER: Thank you. Jeffrey?

9 MEMBER WILLIAMS: I'm very pleased with this list of items to  
10 emphasize. My main presentation today was to give an  
11 example of using '87 VW Golfs to show why one really needs  
12 to look at many of these issues. You preempted me a little  
13 bit, but maybe I preempted you, too, because I think you'll  
14 find that your estimate of the resources for analysis are  
15 considerable underestimates. I can speak from bitter  
16 personal experience over the last weeks trying to get  
17 today's talk ready. But I think you'll find also that it's  
18 much more complex than any of us really would like to agree.

19 MS. MORROW: Yeah.

20 MEMBER WILLIAMS: But I'm definitely in favor of all of the  
21 topics and the emphasis.

22 MS. MORROW: Well, Jeffrey, also if you have any data that we  
23 can use for analysis, I mean you could provide us comments  
24 on that because, you know, we've - or Sierra, ARB, and BAR  
25

1 have brainstormed to look at the data source and so if there  
2 are additional data sources, we would definitely -

3 CHAIR WEISSER: I'm afraid before we'd be able to share that  
4 data we'd need an opinion from our attorney.

5 MALE: - Confidentiality agreements. I - you know, that was one  
6 thing that I was going to mention and I do want to highlight  
7 that if the IMRC Committee Members or the public have data  
8 specific to any of these analysis tasks, arms are wide open.  
9 As anyone who has analyzed emissions data in the past knows  
10 you're often hamstrung by sort of the quality and quantity  
11 of data that are available. So, you know, from us, as well  
12 as ARB and BAR, we would appreciate any ideas.

13 MEMBER WILLIAMS: I'd like to say you're almost hamstrung by the  
14 enormous quantity of data available. The amount that I've  
15 gotten now is some 70 million records and it's a bit hard to  
16 keep track of it all.

17 MS. MORROW: You know, I don't -

18 MEMBER WILLIAMS: Well, it says on the green dot -

19 CHAIR WEISSER: Here why don't you use this one.

20 MEMBER WILLIAMS: It's probably the optimal outcome anyway. The  
21 - well, actually, it's not the data that matter, well, you  
22 can have the computer programs that I've spent the last  
23 several months writing that clean the data. That's where  
24 the work is really, as I think you all know.

25 CHAIR WEISSER: Mr. Pearman?

1 MEMBER PEARMAN: I'd just like to inquire about how ARB sees as  
2 the purpose of this project. When I look at the items  
3 you're investigating, it seems that you kind of accept the  
4 universe of who and what is getting tested in the entire  
5 breadth of the number of vehicles being tested and just  
6 looked at how that interfaced with the stations and the  
7 testing program, but not at excluding those vehicles that  
8 don't need to be in the program. We got an email, I guess  
9 the Committee did, from ARB about Smog Check and Test-Only  
10 stations and it points out that the high-polluting cars make  
11 up only 10 percent of the cars on the road, but put out  
12 about 50% of the total pollution. And so I look at your  
13 issues to investigate, I don't see that you're getting to  
14 focusing on that 10 percent and so I look at this as an  
15 evaluation and improvement of the program project. What I  
16 see here is just accepting as it is and fine-tuning the  
17 millions of vehicles that are in the program and how they  
18 interact with the stations. Can you comment on that?

19 MS. MORROW: Yes, we'd love to have you provide that comment to  
20 us so that when we look at the analysis plan, we can  
21 consider it. From ARB's perspective, we are, as always,  
22 looking for emission reduction, so anywhere where we can  
23 find additional emission reductions or improve the program,  
24 I think that would be a positive outcome.

1 CHAIR WEISSER: Well, a great question and a great answer. What  
2 I'm gonna suggest is that it would be desirable for you to,  
3 if you could, Sylvia, I mean if ARB could, kind of write up  
4 a - something that we could post on our website, we could  
5 send out through an ET blast, whatever, that - you know, to  
6 formalize what sort of input you want. Just what you've  
7 said to us. You know, the sorts of questions that you are  
8 welcoming from the public and from this Committee. I think  
9 it would be helpful to make sure that we communicate that  
10 very clearly, the scope of input desired. Jude?

11 MEMBER LAMARE: Thank you, Mr. Chairman. Jeff mentioned the  
12 overwhelming database and my thought in looking at this is  
13 can't we isolate and work down to a more meaningful level  
14 than Statewide Smog Check when ask these questions. When  
15 this Committee looked at it's Consumer Survey last year, we  
16 found that there were significant variations by air basin  
17 and the program probably works differently in different air  
18 basins. There are a number of reasons for that, including  
19 cultural differences within the State. And I think that at  
20 this point, trying to narrow down and get meaningful  
21 conclusions will require the State to narrow it's geographic  
22 focus somewhat and try to limit the number of variables  
23 under analysis by looking at a few places in the State. For  
24 example, Los Angeles, Fresno, San Jose. Something  
25 manageable, where you've got so many vehicles going through

1 the program, recognizing that we really would prefer to look  
2 at the 10 percent of the vehicles that are the worst  
3 performing vehicles on the road and not simply be getting  
4 information about marginal fails by vehicles that are, say,  
5 you know, in the '90s. Why not look just at '76 to '90  
6 vehicles or '89 vehicles? Why not look specifically at the  
7 top 10 percent, well mostly like to fail or high-emitting  
8 vehicles, and how they move through the Smog Check system  
9 and what the differences are between some major air basins.  
10 So, if indeed, there are statistically significant  
11 differences in what happens to such a vehicle in Los Angeles  
12 compared to San Diego compared to Fresno that the Bureau  
13 might then focus more attention on problem areas rather than  
14 vague general manifestos to the State as a whole. Thank  
15 you.

16 CHAIR WEISSER: I - are there any other comments from Members?

17 Couple of - couple of things. We need to figure out, Rocky,  
18 how we're gonna organize the Committee's response to this  
19 request for information and I'm not sure what the best  
20 mechanism is, but it would seem to me that as a starting  
21 point, you're gonna want to send out some sort of  
22 solicitation for input from the Committee so we can get  
23 issues like Jude or Mr. Pearman or others have raised, we  
24 can start getting those down on a list and then, of course,  
25 in our next meeting, we'll have an opportunity to talk about

1       it. And then following that, we would be able to submit  
2       something in writing to Sylvia and company. I'm not sure  
3       there's a - what? Well, what do you suggest, Jude?

4   MEMBER LAMARE: Sylvia started her comment by saying she would  
5       like individuals to comment in writing to her before the  
6       next IMRC meeting. This isn't something where we as an IMRC  
7       - as I understand it, as an IMRC, we don't have to agree on  
8       our comments -

9   CHAIR WEISSER: No. Okay.

10   MEMBER LAMARE: - it's just input.

11   CHAIR WEISSER: So it's a free-for-all. Very good, fine. We  
12       can do that. I think it would be desirable for Members of  
13       the Committee to copy others Members of the Committee as to  
14       what they're putting in, unless they, for one reason or  
15       another, feel uncomfortable in doing that, I would urge we  
16       send a copy of our comments to Sylvia, to Rocky, who can  
17       distribute them to the rest of the Committee. I'm just  
18       gonna make a recommendation that you consider asking the  
19       consultant to occasionally translate their findings in terms  
20       of the numbers that spin out in tons per day to compare  
21       those to easily understood other comparable numbers. What  
22       I'm thinking specifically is under - any one of these  
23       questions might result in a savings of X number of tons per  
24       day. It would be helpful for the decision-makers in the  
25       legislature and the Administration and people who provide

1 advice like Members of this Committee to understand the  
2 relative size of that emission reduction. Compare it to  
3 something that we know. Like the emission reductions we  
4 lost when the legislature extended the exemption from four  
5 to six years. Emission reductions that were foregoing  
6 because we don't have an annual inspection for cars 15 years  
7 and older. Some comparable terms, I think, would be helpful  
8 to decision-makers.

9 MS. MORROW: Well, one of the things, Vic, is that, you know, we  
10 do have a column in here that talks about the potential  
11 emissions impact and right now we just have a description,  
12 you know, low, moderate, and high and that's because many  
13 times, you know, you have an idea of what may be out there  
14 that are lost emissions, but until you actually do the  
15 analysis, you don't actually know what the actual tonnage is  
16 with -

17 CHAIR WEISSER: I understand. No, I'm talking about after, you  
18 know, in the - after the analysis is done. When you prepare  
19 a summary report, if you just toss numbers out to folks,  
20 they don't get it as readily, necessarily, as readily as  
21 they might if you compare it against something that they can  
22 judge in a relative sense. Now, I pick the two things that  
23 I happened to chose because they represent issues where I  
24 think the State is missing, you know, a wonderful  
25 opportunity for emission reductions. And things that you've

1 recommended and that we've supported, so I would think you  
2 might want to - anyhow, that's my biases. Any other  
3 comments or questions? Okay, we'll take some public  
4 comment, then, Bud?

5 MR. RICE: Good morning. My apologies for being a little tardy  
6 this morning. First comment, Rocky, you're looking good in  
7 that little -

8 CHAIR WEISSER: You're way too late for that.

9 MR. RICE: All right. First comment I wanted to make was as -  
10 as you look at what was displayed on the screen, the topics  
11 look great, kind of like what you were saying, Jeffrey, the  
12 topics look great and as you're going down that list, you  
13 go, well that make sense, well that makes sense. My only  
14 comment would be that those things don't happen in  
15 isolation. Okay. They don't happen in isolation. I kinda  
16 look at this as if going back to the old school days, we're  
17 kind of on a - not just a two-seater teeter-totter, but  
18 we're on a four-seater teeter-totter, okay. And the four  
19 seats are the air, the public, the service providers, and  
20 the policy makers and we're all sitting on this teeter-  
21 totter kind of moving around a little bit and as something  
22 comes up on the list, you almost have to use a measuring  
23 stick of what happens to the teeter-totter. All right,  
24 because what - what would be really good for the air is we  
25 all stop driving cars. Well, the teeter-totter's gonna tilt

1 one way, great for the air, the public's not gonna put up  
2 with that, service providers are gonna be squawking and the  
3 policy-makers are gonna get voted out of office, so that  
4 doesn't work. So you have to have something on the list  
5 that when you say, yeah, let's go attack that one, you've  
6 gotta think about what happens to the four-seater teeter-  
7 totter because it has to work all the way around the horn or  
8 you got problems. Thank you.

9 CHAIR WEISSER: Thanks, Bud. Are there other comments from the  
10 public? Mr. Ward?

11 MR. WARD: (inaudible)

12 CHAIR WEISSER: On the - the question was, for those of you who  
13 were listening and couldn't hear the question, and the  
14 question came from Randy Ward - is the listing of potential  
15 areas of analysis prepared by the ARB going to be on the  
16 IMRC website and our Executive Officer, Rocky Carlisle,  
17 nodded his head up and down indicating affirmatively it  
18 would be. Sylvia just charged up here, so what do you have  
19 to say to that?

20 MS. MORROW: I will transmit a copy of the table to Rocky to  
21 make sure that it is placed on your website.

22 CHAIR WEISSER: Very good. Any other public comments? Mr.  
23 Peters?

24 MR. PETERS: Charlie Peters, Clean Air Performance  
25 Professionals, which is a coalition of motorists. Back in

1 '94, we presented to the Committee some questions about  
2 where we're at and where we're going. We've never gotten  
3 any answers to those and about the possibility of having an  
4 audit system to find out what's really going on here. I'm  
5 going back here to an October '93 letter, which has been  
6 provided to the Committee on numerous occasions to Mr. Jim  
7 Shoening , Chief of the Bureau of Automotive Repair  
8 concerning a meeting that took place with the Bureau of  
9 Automotive Repair, oil companies, automotive repair  
10 associations, garage owners, mechanics. An agreement to do  
11 a pilot study to find out if, in fact, we could implement a  
12 policy that would improve performance. Everybody in the  
13 meeting agreed that there were huge opportunities to  
14 improve. The meeting went on for some time deciding on how  
15 we were going to analyze what we needed to do and where the  
16 problems were and where they weren't and so on and so forth.  
17 We - a number of people in that meeting said, no, we want to  
18 do something to see if we can change behavior and improve  
19 performance and improve how the public is treated and  
20 improve how the system works. Now, there was an agreement  
21 to start that pilot study within 45 days. We're still  
22 waiting for that. Specific things that has an ability of  
23 evaluating what is going on and whether or not policies can  
24 be improved was provided in a letter from Quality Tune-Up to  
25 the legislature and has been provided on numerous occasions

1 to this Committee, dated February 8<sup>th</sup>, '94, with specific  
2 polices to evaluate and measure improvements in performance  
3 with improved oversight. We don't seem to be interested to  
4 you, Committee, here in my humble opinion, don't seem to be  
5 much interested in anything other than trying to move boxes  
6 around rather than better serve the public and take care of  
7 the air. When I provide to you evidence with a Memo from  
8 the Air Resources Board that 1.43 million daily rental  
9 trucks with out-of-State plates run around the State of  
10 California, none of them ever gets a Smog Check anywhere in  
11 the country and you say we can't find any low-hanging fruit  
12 when you have consumers with cars running around with out-  
13 of-State plates, with plates that are registered in zip  
14 codes that don't require it, you do surveys and you don't  
15 find out whether - do a comprehensive survey to find out  
16 what those cars are, it certainly calls into question what  
17 this Committee is about and where it's really trying to go  
18 and it doesn't appear to me to be - to match the rhetoric.  
19 Thank you.

20 CHAIR WEISSER: Thank you, Mr. Peters. What I would urge you to  
21 do is to summarize the issues you think need to be looked at  
22 and to send those in to us or to the ARB and we will  
23 transfer - you should give them an opportunity to consider  
24 your suggestions made as early as '94 or before once again.  
25

1 MR. PETERS: I provided that to the Committee and the Committee  
2 removed every one of them with the exception of the one that  
3 has been considered by -

4 CHAIR WEISSER: Thank you, Mr. Peters. What I'm - I will  
5 suggest that you take this opportunity to provide the ARB  
6 with input at this opportunity. Thank you. Are there any  
7 other comments from the public? Okay. This item is  
8 concluded now. A Committee Member whose name will go  
9 unmentioned has demanded a 10-minute bio-break, so we're  
10 gonna recess for 10 minutes starting now. Thank you.

11 - o0o -

12 CHAIR WEISSER: Okay, the meeting is now back in session. We  
13 will now proceed to a presentation from Sierra Research - Mr.  
14 Phil Heirigs. Did I butcher the name, Phil?

15 MR. HEIRIGS: Actually, you got pretty close. It's actually  
16 with an S on the end, though - Heirigs.

17 CHAIR WEISSER: Well, I will fire the Executive Officer of the-

18 MR. HEIRIGS: Believe me, I have seen that spelled many, many  
19 different ways.

20 CHAIR WEISSER: All the nice things we said to you, Rocky, are  
21 now deleted from the record.

22 MR. HEIRIGS: Quite all right. Believe me, I've had it spelled  
23 different ways and pronounced many different ways. Again,  
24 my name is Phil Heirigs. I'm with Sierra Research. I've  
25 been with Sierra for probably close to fourteen years now.

1 Before that, I was at the Air Resources Board for almost  
2 seven years primarily doing automotive emissions data  
3 analysis and those kinds of projects. Since this is my  
4 first time before the IMRC, I thought I'd give you that sort  
5 of brief history of my background. This particular  
6 presentation today I was asked to give to hopefully clarify  
7 some of the specifics related to a more stringent ASM cut-  
8 points analysis that we had done about a year or so ago, I  
9 think, when the bulk of the effort was actually completed.  
10 In the presentation, a lot of times we refer to as - these  
11 cut-points as vehicle-specific cut-points. That's kind of a  
12 misnomer. It's really vehicle groups specific cut-points.  
13 I mean, we're not gonna have 13 or 20 or 30 million  
14 different cut-points, but it's more vehicle group specific  
15 cut-points. Okay, right click. Rocky, one more. There we  
16 go. So the goal here was to one, look at more stringent ASM  
17 cut-points, but more importantly to develop those or try to  
18 develop those cut-points that - in such a manner that would  
19 maximize the identification of vehicles with identifiable or  
20 significant emission control system defects while minimizing  
21 false failures. I mean, it doesn't do much good to lower,  
22 you know, all cut-points by 90 percent and be real happy  
23 that your emissions benefits go up when, in fact, you end up  
24 falsely failing vehicles that just, you know, nothing is  
25 wrong with them and in the field would be difficult to deal

1 with. So that was the goal. And just by way of background  
2 and a refresher here, note that the ASM test measures  
3 emissions at basically two different speed load points.  
4 You've got 15 miles an hour and 25 miles an hour. Slightly  
5 different loads apply to those two test points. One of the  
6 concerns about the ASM, although it's a whole lot better  
7 than the TSI, is there may be certain vehicles, vehicle  
8 types, that those two points may not accurately represent  
9 what's going on in stop-and-go driving. So, we were given  
10 this task of okay, we have the ASM test. It's a whole lot  
11 better than a two-speed idle test, but we want to do  
12 something with the cut-points here, how can we improve our  
13 confidence that if we go with more stringent ASM cut-points  
14 that we can identify defects that result in elevated  
15 emissions over a broader range of driving conditions. And  
16 on the flip side, how do we identify those vehicles where we  
17 shouldn't do anything to the cut-points. So, it's sort of a  
18 two - kind of a two-pronged approach here. We want to  
19 identify those vehicles that would benefit from more  
20 stringent cut-points and vehicles that wouldn't, obviously  
21 we want to leave those alone. So our general approach was  
22 to compare the ASM failure rates in California to failure  
23 rates in states that are running transient emissions tests,  
24 and that would be either the IM147 and the IM240 tests. The  
25 IM147 test is sort of a subset of the IM240. The IM240 is a

1 subset of the federal test procedure used to certify  
2 vehicles federally and in California. Therefore, you get a  
3 very good correlation between these transient tests and the  
4 federal test procedure and as it happens, the federal test  
5 procedure actually is a very good representation of  
6 emissions over sort of standard customer service. So, what  
7 we looked at and what we were hoping to see is that vehicles  
8 that - with higher ASM failure rates compared to the IM147  
9 and the IM240 failure rates, those vehicles we want to leave  
10 alone and what we really targeted were those vehicles that  
11 have low ASM failure rates in California compared to some of  
12 the failure rates that we saw in Arizona for the IM147 test  
13 and then the Wisconsin program for the IM240 test. And I  
14 preface this by noting although we call these vehicle  
15 specific cut-points, they're really vehicle groups. And so  
16 what we did is we segregated the data by model year and note  
17 that we just looked at pre-1996 model year for a couple  
18 reasons. Primarily, there aren't a lot of data on transient  
19 tests for 1996 and newer vehicles and the reason why is most  
20 programs have opted to do an OBD-only test on those  
21 vehicles. So, we didn't really have the data to do '96 and  
22 newer, so we just left this at pre-96 model years, we then  
23 broke the data down by manufacturer. For example, General  
24 Motors or Toyota. We broke it down by make, so your GM  
25 would go into sort of, you know, Chevrolet or Pontiac. Your

1 Toyota would go into say, Lexus or Scion or Toyota. We  
2 looked at models and then once we had it at that level, we  
3 looked at engine displacement, number of cylinders and then  
4 transmission type. On engine displacement and number of  
5 cylinders, we probably could have used one or the other and  
6 probably would have been at the same place, but we did break  
7 it down to that level. In many cases, if we had small  
8 sample sizes, we sort of segregated up from this ideal level  
9 of de-segregation, if you will. For example - and we came up  
10 with this number - sample size, sort of bogey at vehicles  
11 less than 50. So, if we had less than 50 in a group, we'd  
12 go up from there. For example, the example I gave here is  
13 you might have a Dodge Aries and a Dodge Shadow, both with  
14 four-cylinder 2.2 liter engine with an automatic  
15 transmission. We'd combine those and so to get over that 50  
16 mark and we wanted to have at least 50 vehicles in each  
17 program. And so once we segregate this data by model year  
18 and engine type, make, model, we looked at the failure rates  
19 that were observed in California versus those failures that  
20 we saw in Arizona and Wisconsin and this appears to have  
21 shifted - I apologize for this table. It shifted over a  
22 bit, but in this example, we're looking at 1992, 3.1 liter,  
23 6 cylinder, automatic transmission, Pontiac. And so, if we  
24 look at the failure rates in California for that vehicle  
25 group, we see that the failure rate is 10.7 percent. Now

1 the model year average for that group, and if this was lined  
2 up the way it's supposed to be, this is going to be the  
3 model year failure rate here, and so in California we see  
4 that this vehicle group has about 11 percent failure rate,  
5 but the model year average as a whole is about 19 percent.  
6 And so we then sort of divided one by the other to get a,  
7 what we'll call a normalized failure rate, so we've got  
8 lower than average failure rate for this vehicle group in  
9 California, and yet when we look at the Arizona and the  
10 Wisconsin data, which are running transient tests, we see  
11 that the failure rate for this vehicle group in Arizona is  
12 almost 27 percent while the model year average is about 16  
13 percent, so it's higher than average in that program. It's  
14 higher than average in the Wisconsin program. And that's  
15 kind of what we were looking at. If a vehicle showed a  
16 lower than average failure rate in California program and a  
17 higher than average failure rate in Arizona and Wisconsin  
18 over the transient test, we would flag those, basically, for  
19 further evaluation. And we developed this term, Relative  
20 Failure Ratios, and all that represents is sort of these  
21 normalized failure rates that we saw in California divided  
22 by those normalized failure rates in Arizona and Wisconsin.  
23 This may be a little bit confusing, but just think of this  
24 as - for these Relative Failure Ratios, a low number, say  
25 less than one, means that we're seeing fewer failures in

1 California on average than we see in Arizona and Wisconsin.  
2 A high number here, over one, means we're seeing more  
3 failures in California than we saw in Arizona and Wisconsin,  
4 therefore, vehicles with a low number here are candidates  
5 for tighter standards. Vehicles with high numbers here, we  
6 want to leave them alone. And this next table is admittedly  
7 very messy, but it gives you an idea of the types of  
8 candidates that we might see to apply for - or apply more  
9 stringent ASM cut-points. And here, I've just listed 1992  
10 model year. When I do these kinds of analyses, and  
11 especially stepping through examples, I like to sort of  
12 focus on a single model or a single model year to make it a  
13 little bit more manageable. And here we see that, you know,  
14 we've got the - all vehicles at the top and that's the  
15 model/year average and then we've got specific vehicles in  
16 this group and you can see, these are all on the low end of  
17 this relative failure ratio. That is, they are experiencing  
18 lower failure rates in California versus what is observed in  
19 Arizona and Wisconsin. And one of the reasons why we went  
20 with failure rates, and I'll explain this a little bit  
21 later, too, is these programs have different cut-points  
22 applied to the I/M programs and so we felt like if we just  
23 looked at failure rates and we compared those failure rates  
24 to the same model year, in a particular area, or particular

1 program, we'd get a good sense of how that vehicle group  
2 faired, compared to the average.

3 CHAIR WEISSER: Let me - if I might just interject one question.

4 And I'm trying to hold off until the end, failing once  
5 again. The cars that are sold in Arizona and Wisconsin are  
6 equipped identically to the cars, that same model, that's  
7 sold in California?

8 MR. HEIRIGS: No, and in fact, I have a slide coming up on that  
9 if you'd like. I mean, basically there - that was one - I  
10 wasn't at the last IMRC meeting where this was discussed,  
11 but my understanding is that was one of the concerns that  
12 there may be different standards applied to vehicles out-of-  
13 state versus in-state and give me about three slides and  
14 we'll address that. So if we look here, I think - where'd  
15 it go? We were showing - here it is. The 3.1 liter  
16 Pontiac, that was the one that we just looked at the  
17 specific numbers where we see that that's lower failure rate  
18 in California versus Arizona and Wisconsin, especially  
19 compared to the model year average failure rates. That  
20 shows up here. And then there are some others and when all  
21 is said and done, you know, across all model years, you're  
22 in the maybe low tens of thousands in terms of different  
23 vehicle groups, so it's quite a few different vehicle groups  
24 that we end up looking at. So, once we identify these  
25 vehicles that are, what we consider candidates for cut-

1 points changes, the next question is well, gee, how much do  
2 we reduce the cut-points by? And I - what was at first  
3 suggested is we could take after-repair data from vehicles  
4 that had failed and then been repaired to pass, take the ASM  
5 data, take the 90<sup>th</sup> percentile and say okay, we're gonna set  
6 that as our after-repair cut-point. The problem is, when  
7 you start looking at those data is you run into issues with  
8 the fast-pass algorithm that's implemented in California,  
9 where once you start looking at the data, you see a whole  
10 lot of records right at the cut-point level for certain  
11 pollutants, you know, typically HC and NOX will be right at  
12 the cut-point level, CO typically will be a bit below  
13 because remember the way the fast-pass works is once all  
14 three pollutants are below the cut-point, we're out of that  
15 mode and into the next. So, looking at - directly at  
16 emissions data, Smog Check data, it didn't make any sense  
17 and so one of the guys working on this kind of came up with  
18 this idea of looking at the cleanest 25 percent of the  
19 vehicles and so we looked at the passing vehicle ASM scores  
20 and they were presented as a fraction of the current cut-  
21 point. And we said, okay, let's look at the cleanest 25  
22 percent and what that tells us for vehicles that have a low  
23 score and as clean as 21 or the first cortile, you'll see  
24 this Q-1 designation up here, that suggests - and say it's  
25 15 percent of the cut-point - that suggests that a properly

1 functioning vehicle meets the cut-points fairly - fairly  
2 readily. On the other hand, a high Q-1 score, if the  
3 cleanest 25 percent are still at 60 percent of the cut-  
4 point, it gets a little dicey in terms of suggesting, you  
5 know, wholesale changes to those cut-points. And so, we did  
6 this analysis in conjunction with the sort of relative  
7 failure rates to try to come up with a set of more stringent  
8 cut-points, where hopefully we're going to minimize the  
9 opportunity for false failures. And what we looked at were  
10 three different cut-point scenarios where these relative  
11 failure ratios were set at less than 1.5, less than 1.25,  
12 and then less than one, and then in all cases, we wanted  
13 these Q-1 scores, or those cleanest 25 percent to be roughly  
14 50 percent - or below 50 percent of the cut-point. So we  
15 sort of established that as our three scenarios. And the  
16 other thing that we were working with here is we applied a  
17 maximum reduction of 30 percent in the cut-point level and  
18 that was based on a review of the California Code of  
19 Regulations that BAR had done that indicated that's the  
20 maximum cut-points could be changed without a change to the  
21 regulations. And so we sort of limited the cut-point change  
22 to a maximum 30% reduction. And so we took the current cut-  
23 points and then we just - for those vehicles that qualified,  
24 based on the relative failure ratios or failure rates, we  
25 just reduced those current cut-points by, you know, this

ratio of the Q-1 score over .5 or a maximum of .7 and so, essentially, what that means is if the Q-1 score is less than .5, you leave it alone, you don't do anything. If the Q-1 score is between .35 and .5, it's kind of this linear ratio between a 30 percent reduction and zero percent reduction and if the Q-1 score is below .35, then you get this maximum 30 percent reduction. And it's sort of confusing to see this for the first time. It's described in the report and I think there are copies of the report on the back table. So here's one the concerns was the use of non-California data. And the fact that there can be different emission standards between the California fleet and what we see in Arizona and Wisconsin. And that's true. Some of those groups may have been certified to slightly different standards. In our view, that's probably gonna have a minimal impact, primarily, because many of the engines in vehicles in this timeframe were equipped with 50-state engine families. I mean, it makes a lot of sense for a manufacturer if they can meet both California and Federal standards. They save a lot of money in certification costs if they just certify to 50-state standards and so most of the vehicles in this group, if it was a 50-state standard, for example, would have met the .41 gram per mile, HC standard or .39 non-methane hydrocarbon standard. They would have met the more stringent between the 7 gram and 3.4

1 gram per mile CO standard so that they would be at 3.4 and  
2 then they would meet the more stringent of the 1 gram  
3 Federal standard or .7 gram per mile NOX standard, so it  
4 would be .7 NOX. And there are a number of vehicles in  
5 quite a few groups that actually did that. Because it just  
6 saves money on certification fees for manufacturers.  
7 Another point to consider is that the age of the vehicles  
8 analyzed here make vehicle migration more likely. And so  
9 you've got this big pot that consists of all the states and  
10 you throw new vehicles into this pot depending upon which  
11 state and then you start mixing it up as time goes on. And  
12 this issue of migration was actually studied pretty  
13 carefully in the mid-90s timeframe to sort of argue for the  
14 National Low Emission Vehicle Program that is, if you go  
15 with an NLEV Program, ultimately you're going to see  
16 benefits in California, you know, as well as other states.  
17 And then, finally, we did this analysis based on relative  
18 failure rates and our hope is that mitigates somewhat the  
19 differences in standards and as a practical matter, when  
20 you're looking at the difference in the certification  
21 standards for these model years, say '81 to about '94,  
22 they're not huge, I mean, especially say the '81 to sort of  
23 late '80s. You've got slight difference in NOX, slightly  
24 more stringent in California, you've got a little bit  
25 difference in CO, higher in California, but as a practical

1 matter, the HC standard's really kind of kept those seal  
2 levels under control. So, I guess, personally, I'm not that  
3 concerned about the use of non-California data because of  
4 these different points. Now, the other issue that came up  
5 and again, a valid issue, is are we just targeting marginal  
6 emitters when we do something like this. You know, clearly,  
7 we're not after, you know, vehicles that are just barely  
8 failing their FTP standards. What we'd ideally like to do  
9 is be able to pull more high emitters into this group and so  
10 what we did, and actually, I did this just in the last  
11 couple of weeks because it's not something I had done for  
12 the report, but it was really to look at the database that I  
13 had used to do the emissions analysis with, which is an ARB  
14 surveillance dataset that has matching FTP and ASM tests, as  
15 well as after-repair data. So, I sort of leached through  
16 that to figure out, okay, which vehicles am I capturing with  
17 each of the three cut-point scenarios and what that shows  
18 and the next slide is real messy as well, but I think it has  
19 some good information in it. We were able to successfully  
20 identify high-emitting vehicles with this approach to  
21 establish tighter cut-points. And again, I apologize for  
22 how many numbers - I think I learned in college that you  
23 weren't supposed to have more than 20 words per page and I  
24 exceeded it here. What we see here, the first 1, 2, 3, 4,  
25 5, 6 columns are the vehicle identifiers, so these are the

1 vehicle-specific groups, if you will. The next columns are  
2 failures with the three different scenarios that we  
3 evaluated where a one is yes and if it's blank, it wouldn't  
4 have failed. So you can see what I did is I pulled all of  
5 the failures for, you know, less than one and a half  
6 relative failure ratios and then what happens if you sort of  
7 decrease that particular parameter, because those were the  
8 three cut-point scenarios we evaluated, and then the last  
9 three columns show the multiple of the FTP standards and you  
10 can see - and so vehicles with more than one times the FTP  
11 standard, you know, you can arguably say look, you could  
12 probably do something with that vehicle. Honestly I'd like  
13 to see two to three on all of these, and in many, we do see  
14 two to three times. The best for, you know, in terms of  
15 what we were able to identify with these cut-points is about  
16 - I keep forgetting I've got this pointer here, is this  
17 Honda Accord here where we see that with two of the three  
18 cut-point scenarios, we identify that car as a failure and,  
19 you know, that thing was up over four grams per mile HC, it  
20 was over 80 grams per mile CO and so, that's a real success  
21 story and honestly I'd like to show you a chart that's full  
22 of those. You're not gonna see it. It's like the nature of  
23 emissions data. But you've seen a lot of high twos and  
24 threes, which to me is very encouraging. But on the flip  
25 side, we see there's a couple down here that are actually at

1 or below the standard for all pollutants and there's our  
2 errors of commission. And anytime you make a cut-point  
3 change where you're going to make the cut-points more  
4 stringent, you're gonna have to live with some number of  
5 errors of commission, it's the nature of the short test. I  
6 mean, if we could spend \$1,000 or \$2,000 per vehicle per  
7 year to run an FTP, we'd know for sure. But we can't do  
8 that. So, you see a couple of vehicles in here where we're  
9 off the mark, but then we see real big success on some  
10 others. So, that kind of gives you an idea of how well this  
11 approach worked to identify high-emitting vehicles and it  
12 wasn't only, you know, just the marginals that are caught  
13 with this approach. So, once we completed our three  
14 different cut-point scenarios, we were tasked with, okay,  
15 what's it gonna do with the failure rates observed in use?  
16 I mentioned earlier that sort of the problem with fast-pass  
17 that if you look at tighter standards, you really can't tell  
18 what's gonna happen because you don't have full duration  
19 scores, so what we had to do as we went to roadside data and  
20 I can't remember how many records we had, probably not quite  
21 20 but over 10,000, so we had a set of - a decent set of  
22 roadside records that were full-duration scores. We  
23 generated sort of the difference in failure rates based on  
24 the current scenario, current cut-points in our three  
25 different scenarios. We did it by model year group and then

1 we kind of applied those ratios to the Smog Check data with,  
2 you know, many millions of records. This was done in the  
3 April to June 2004 timeframe in terms of the Smog Check  
4 data. So that would be if we implemented this, you know,  
5 two years ago, this is what we'd see. As we go out in time,  
6 the difference in the increase in failure rate's not going  
7 to be as large because we're going to have fewer vehicles in  
8 this, you know, pre-90 (static in recording) so, you know,  
9 that delta in failure rate it will go down in the future.  
10 And you can see, you know, scenario one which is the most  
11 stringent. The failure rate went up by 2.4 percent from  
12 10.4 to 2.8 and slightly less for the other two scenarios.  
13 The impact on Statewide raw plus NOX emissions, and I wish I  
14 had a good comparison point here, these are in terms of tons  
15 per day, and this is for calendar year 2010, so we've  
16 forecasted this to 2010 and then we've used, in fact, 2002  
17 to generate these estimates for enhanced areas of the State,  
18 so it's not - it's for enhanced areas that are running ASM  
19 tests and you can see the different scenarios give you  
20 between 5.5 and 7.8 tons per day of raw plus NOX reduction,  
21 which, you know, honestly, is on the level of the sort of  
22 reductions that many of ARB's, you know, current control  
23 strategies are sort of aimed at. I think the days of  
24 getting 50 to 100 tons per day raw plus NOX are pretty much  
25 gone and for a relative small tweak, of course, from my

1 perspective it's a small tweak, because I just crunch the  
2 numbers here, but for a relatively small tweak in these cut-  
3 points we - you're getting a decent benefit. So that's all  
4 I have and I'd be glad to answer any questions.

5 CHAIR WEISSER: Did you - do you have any cost-effectiveness  
6 numbers (overlapping)?

7 MALE: They are presented in the report and I can't remember  
8 what it is on the top - the top of my head. I think on the  
9 order of \$7,500 per ton.

10 CHAIR WEISSER: So it's -

11 MALE: So it's not, yeah, it's not out of line. They're in the  
12 report, though.

13 CHAIR WEISSER: Well, I'm sure there are lots of questions.

14 I'll start from my far left, appropriately occupied by Jude  
15 Lamare.

16 MEMBER LAMARE: Thank you, Mr. Chairman. No questions. I think  
17 this report really helped clarify the study. But, I would  
18 just add that in terms of the emission - the significance of  
19 the emission reductions relative to the cost and the cost of  
20 implementation I think is much more significant than  
21 presented today and certainly just the 2007, 8, and 9  
22 emissions are very, very important to our State in reducing  
23 air pollution impacts that the level of - that 2010  
24 emissions is important for air quality planning and it's  
25 kind of a standard and we like to use that so that we're

1 talking apples and apples, but I wouldn't urge this change  
2 be made immediately, as quickly as possible, to get those  
3 tons that are there now, 2006, 7, 8, 9, obviously larger  
4 numbers than 2010 numbers and they're very important. Thank  
5 you.

6 MR. HEIRIGS: Just as a sort of relative, in terms of relative  
7 terms, that's - the 7.8 in 6, 7, 8 is about two percent of  
8 the gasoline vehicle inventory. So you're looking at about  
9 two percent reduction from, you know, that group of  
10 vehicles.

11 CHAIR WEISSER: Thank you. Roger?

12 MEMBER NICKEY: This is probably more of a comment than a  
13 question, but we keep, we have focused on tailpipe  
14 emissions, we have two other emission systems on the vehicle  
15 to deal with. We have evaporative, we also have crankcase.  
16 How do you deal with failures that - vehicles that are  
17 relatively low exhaust emissions and hardly ever fail  
18 exhaust emissions test, but have a higher likelihood of  
19 failing, say crankcase?

20 MR. HEIRIGS: You know, that's a good question because I guess  
21 that's something we could - we didn't look at that. But -

22 MEMBER NICKEY: Just -

23 MR. HEIRIGS: It is, it's a - that's a very valid point,  
24 especially when you start looking at sort at that group of  
25 vehicles that we targeted here which, you know, all of them

1 '81 to '90 in that range, which are getting to the age where  
2 you're gonna see a lot of evap problems. So, and I'm trying  
3 to think out loud a little bit. I guess you could do that  
4 kind of analysis looking at some of the Arizona data where  
5 they've been running the low pressure evap test for many  
6 years there. But we didn't target it here.

7 MEMBER NICKEY: Yeah, I'm not talking about evap so much as I am  
8 crankcase and I can cite, just for example, later model  
9 Fords, 5.4, very low tailpipe emissions, but they have a lot  
10 of PCV failures because they have a particular hose in one  
11 particular place that manages to suck itself shut, which  
12 shuts off the whole crankcase vent system, which negates the  
13 whole process. Chrysler products have low tailpipe  
14 emissions, but a real high likelihood of failing crankcase  
15 because they break their hoses because of whatever reason.

16 MR. HEIRIGS: Yeah, that's a good point. We didn't consider it  
17 and crankcase is a big deal. Maybe not on a fleet-wide  
18 basis, but certainly on a gram per mile basis, because 4.68  
19 grams per mile, depending on what side is disconnected and  
20 the size of the engine and things.

21 MEMBER NICKEY: How does a crankcase failure affect the figures  
22 that you have here?

23 MR. HEIRIGS: It wouldn't.

24 MEMBER NICKEY: Are you considering a fail of fail or just  
25 tailpipe failure?

1 MR. HEIRIGS: We just looked at tailpipe failures.

2 CHAIR WEISSER: But this might be something, Roger, that you  
3 might want to mention in your comments regarding the future  
4 contract.

5 MR. HEIRIGS: Certainly, yeah, certainly on the task list, add  
6 that. Because I hadn't thought about that. That's a good  
7 idea.

8 CHAIR WEISSER: Jeffrey?

9 MEMBER WILLIAMS: I'd like a clarification about the comparison  
10 among the three states. I accept your reasons for saying  
11 that it's a valid comparison, but I worry about one other,  
12 which concerns the surviving cars in the three states.  
13 Imagine a situation where this particular Pontiac just  
14 didn't get driven very much typically in California and it  
15 got driven a lot in Wisconsin, you would expect, just as a  
16 function of mileage, that the failure rate would be lower in  
17 California. It's about the composition of the two Pontiac  
18 fleets. Did you compare that?

19 MR. HEIRIGS: We did look at that. That'd be reasonably easy to  
20 do. Most, I know Arizona's got odometer, I know California  
21 has odometer, I believe Wisconsin has odometer. That'd be  
22 fairly easy analysis to do.

23 MEMBER WILLIAMS: Yeah, I'm concerned you didn't do that.

24 MR. HEIRIGS: Yeah, but you know, once we start look - once we  
25 go ahead in time, what I've seen, I've looked at odometer

1 data quite a lot in various I/M programs and inevitably what  
2 I see is you get this increase that you'd expect as vehicles  
3 age until you hit about 15 years, then it just like levels  
4 off at about 150,000 miles. And what's happening, I  
5 believe, is that vehicles that get driven a lot when they're  
6 new, they're not out there by the time you get to 10, 12, 15  
7 years old. And so, my expectation is we probably see  
8 something similar here. But, we could do that analysis.

9 CHAIR WEISSER: Okay. I'm not sure what the implications are,  
10 Jeffrey, of your question.

11 MEMBER WILLIAMS: (unclear)

12 CHAIR WEISSER: Okay. We'll go to Dennis.

13 MEMBER DECOTA: I can't help but notice the differential in  
14 failure rates between California, Arizona, and Wisconsin.

15 MR. HEIRIGS: For some vehicle groups.

16 MEMBER DECOTA: For some vehicles, but they're - they're large.

17 MR. HEIRIGS: Absolutely. You know -

18 MEMBER DECOTA: Why?

19 MR. HEIRIGS: Well - okay, the theory is that we're working off  
20 of is that potentially, the ASM, because you're looking at  
21 two-speed-load points, you're not capturing sort of the  
22 complete range of driving. You're not capturing the  
23 complete range of driving in an IM147 test, you're not in an  
24 IM240 test, but you're getting closer, okay. So one thing  
25 that you're certainly getting with the IM147 and the IM240

1 is transient operation. You're not getting that with the  
2 ASM. The other thing you're getting is decells. You're not  
3 getting that with -

4 CHAIR WEISSER: De -

5 MR. HEIRIGS: Decelerations.

6 MEMBER DECOTA: Right.

7 CHAIR WEISSER: Thank you.

8 MR. HEIRIGS: You're not getting that with an ASM test. I mean,  
9 if you've got a problem with fuel shut-off with decell, you  
10 would see that in an IM240 - IM147, you wouldn't see that in  
11 an ASM. And so the thought is that's one of the things  
12 that's going on. It's just their different test cycles and  
13 there may - at least in my view and I think in a lot of  
14 people's view, the IM147, the IM240 test is a better  
15 representation of on-road driving than a two-point test with  
16 the ASM. It just is.

17 MEMBER DECOTA: What about the actual fuel make-up of Wisconsin  
18 and Arizona as compared to California?

19 MR. HEIRIGS: Yeah, the hope is that we get around that a little  
20 bit. And you're right, they're gonna be different, they've  
21 got different seasons, I mean, we took a two-year chunk of  
22 data, so we're seeing winter, summer, whatever. But, the  
23 hope is by looking at kind of the relative failures, within  
24 each program we look at kind of a model year average and we  
25 use that kind of as the denominator in each of the program

1 area of failure rates, okay. And so, our hope was by  
2 looking at the failure rates compared to a model year  
3 average in each program, we're hopefully getting around  
4 these differences in fuels and temperatures and things.

5 MEMBER DECOTA: Could it also be a factor that just opposite of  
6 Dr. Williams' suggestion was more miles driven would have a  
7 tendency to reduce emission in failure points versus a car  
8 that was not in Arizona or Wisconsin driven as much as a car  
9 in California?

10 MR. HEIRIGS: I'm disinclined to go with that. A real smart guy  
11 said one time - I don't know if you guys know Harold Haskew  
12 (phonetic) but he's an ex-GM engineer. He was there for 40  
13 years. He's consulting now, he does work for CARB and  
14 others and I remember sitting in a meeting, real - very  
15 similar to this and his point was, look, it's how much fuel  
16 you push through the inch and how much exhaust you push over  
17 the catalyst and I kinda, I have a sense he's right.

18 MEMBER DECOTA: I would agree. The vehicles that are on your  
19 list in California currently would most likely be direct  
20 test-only, only.

21 MR. HEIRIGS: Yeah, could very well be.

22 MEMBER DECOTA: And including all those makes and models on that  
23 year. Are we comparing apples to apples in the way that -

24 MR. HEIRIGS: You know, it's impossible. I mean we're comparing  
25 data from different programs, so we may not be precisely

1 comparing apples to apples, but certainly we're getting darn  
2 close, I think.

3 MEMBER DECOTA: Thank you.

4 CHAIR WEISSER: Mr. Pearman?

5 MEMBER PEARMAN: First, when you talk about the use of non-

6 California data and that the survey vehicles were equipped  
7 with 50-state engine families, what does that say about  
8 whether they have the same emissions controls?

9 MR. HEIRIGS: Well, okay, I apologize. I should have explained  
10 that a little bit more thoroughly. In (static in recording)  
11 - I saw Mike back here, he can correct me if I'm wrong, but  
12 I think I had this right. The Air Resources Board does what  
13 they call sort of routine surveillance programs and what  
14 that means is they send a bunch of letters out to folks in  
15 the Southern California area and say look, please give us  
16 our car for a week, let's say. And while we've got your  
17 car, we're gonna subject it to a series of tests, we'll give  
18 you a rental, we'll give you whatever, \$50, \$100, whatever  
19 the incentive is. And so they get these vehicles from  
20 customer service and they tell folks in this letter, look,  
21 if you've tampered with your vehicle, no big deal. Okay,  
22 we're not gonna do anything, you know, we just wanna see,  
23 we're doing a study of in-use emissions, we really need to  
24 see your vehicle in its sort of standard state, if you will.  
25 And so they get these vehicles in from the community,

1 essentially, in Southern California. They take them to El  
2 Monte, sometimes they'll contract this work out, but they'll  
3 take them to the El Monte lab, they'll put them through a  
4 series of tests and the tests I was looking at included a  
5 baseline ASM test, where they stick it on a dyno, run the  
6 ASM test, as well as federal test procedure tests so that  
7 you've got the full, you know, 24 to 48 hour soak, you're  
8 running at a very tight window in terms of temperature,  
9 you're following, you know, the 1300.05 LA-4 speed time  
10 trace, you've got all these very standardized tests you're  
11 running, but then what I was very interested in was that, as  
12 well as this ASM - matching ASM. And so, these surveillance  
13 projects are intended to get a picture of how the fleet is  
14 operating in customer service. And so it's not a roadside  
15 pullover. It's much more extensive than that and, like I  
16 say, and then vehicles that fail a certain set of cut-points  
17 may get repair, may be retested to see, okay, what are the  
18 benefits of repair if we have sort of this set of cut-  
19 points.

20 MEMBER PEARMAN: Well, along that line, you had taken great  
21 pains to make sure the category of groups you looked at had  
22 at least 50 vehicles, but the surveillance data might have  
23 had one, two - 50 - what?

24 MR. HEIRIGS: Yeah, they're if I - and the numbers are in the  
25 report. If I remember right, I probably had 500 or 600

1 vehicles. There's just - that's the one thing that - where  
2 you're really hamstrung by data. I mean, there's just not a  
3 lot of FTP data available because it is so expensive to  
4 collect. And so you sort of do the best with what you've  
5 got.

6 MEMBER PEARMAN: And then the chart where you had the vehicle  
7 categories and the relative year failure rates and you  
8 compare those to the results of the surveillance data and  
9 you had like the highest ones, less than 1.5, etcetera. Did  
10 you do the reverse correlation? Would there be any value in  
11 looking at the failure rate to be viewed from the  
12 surveillance data and then running across to see where they  
13 match up with these vehicles that were grouped like that?

14 MR. HEIRIGS: No, I didn't. No, that's a good point. I did not  
15 do that.

16 MEMBER PEARMAN: And the other, if you could just comment on one  
17 thing, you indicated that the high Q-1 score, 60 percent of  
18 the cut-point was dicey, but then in your scenarios, you  
19 went with less than 0.5, which means 49 percent, so why  
20 would 60 percent be dicey, but 49 percent is not dicey?

21 MR. HEIRIGS: You know, it's kind of a judgment call. We really  
22 felt like - and if it was 49 percent, that adjustment would  
23 have only been, what, 30 percent over 2, so what is that,  
24 like a couple percent? So, because we didn't just say,  
25 okay, we're gonna reduce everything by 30 percent. If

1       you're between say that .49 level and down to .35, it sort  
2       of went linearly between sort of a zero percent reduction  
3       and the maximum of 30 percent.

4 MEMBER PEARMAN:   Okay.   Thank you.

5 CHAIR WEISSER:   Great questions.   Dennis?

6 MEMBER DECOTA:   I need to help me understand something.   You  
7       basically stated earlier that the decell test in Arizona and  
8       Wyoming could be some of the differentials -

9 MR. HEIRIGS:   That's and example of -

10 MEMBER DECOTA:   Of an example.

11 MR. HEIRIGS:   - of the differences that you would see in sort of  
12       standard stop-and-go driving that you wouldn't capture in  
13       the ASM.

14 MEMBER DECOTA:   Right.

15 MR. HEIRIGS:   It's purely intended as an example.

16 MEMBER DECOTA:   Okay.   In your opinion, if these vehicles were  
17       tested with a two-speed idle under the ASM, would it help it  
18       make it more equivalent in the area of comparison?

19 MR. HEIRIGS:   In my opinion, so you're asking me if we had a  
20       two-speed idle to the ASM would you have an improved  
21       performance?

22 MEMBER DECOTA:   Would you have an improved tested - test  
23       methodology that may compare more equally in failure rates  
24       with the other two states?

1 MR. HEIRIGS: Yeah, I've look at that in other projects and  
2 yeah, I think it would. Adding a two-speed idle to the ASM,  
3 if you know, everything else being equal, there is benefit  
4 there.

5 MEMBER DECOTA: Thank you.

6 MEMBER NICKEY: Dennis, do you mean just the two-speed idle or  
7 idle?

8 CHAIR WEISSER: Roger - Roger, do you have a question?

9 MEMBER NICKEY: That's okay. Did you mean idle or two-speed  
10 idle?

11 MR. HEIRIGS: Two-speed idle.

12 MEMBER NICKEY: The whole two-speed idle test, not just the  
13 idle. I'm just curious.

14 MR. HEIRIGS: Yeah, on top of the ASM.

15 MEMBER NICKEY: Yes, sir.

16 MR. HEIRIGS: Yeah.

17 CHAIR WEISSER: Couple of silly questions from me. You indicate  
18 that gee, if you have failure rates that are substantially  
19 below that of these other states then we should be  
20 considering raising the cut-points, but you reject that  
21 reverse of that notion when we have failure rates  
22 considerably above the other states, you're not saying we  
23 reduce the cut-points.

1 MR. HEIRIGS: I mean, that's an option. Certainly that would  
2 potentially point to vehicles that may benefit from, you  
3 know, some loosening of cut-points.

4 CHAIR WEISSER: When I step back at this issue, I try to look at  
5 it in terms of the emission reductions we can gain through  
6 the investment of societal dollars, where, you know,  
7 wherever the dollars are coming from. And one of the  
8 questions that - or issues that I've heard over the years is  
9 that, you know, adjusting the cut-points marginally, you end  
10 up failing cars that on occasion are much more difficult to  
11 repair than cars that fail by a whole bunch. So you're  
12 relative cost-effectiveness is not quite as, necessarily,  
13 quite as good. Is that gonna be the case here?

14 MR. HEIRIGS: Well, that's why I presented the second messy  
15 table of the presentation to give a flavor of sort of what  
16 multiple of standards are these vehicles at that we're  
17 talking about that would be captured with this new set of  
18 cut-points. Mr. Pearman brings up a great point, it's - our  
19 dataset isn't real large on the FTP data, but - but they're  
20 a very good data. If we had a larger sample, we would, you  
21 know, may see much the same. But I think the Honda that I  
22 pointed out that was at 4 grams per mile HC and 80 grams per  
23 mile CO, I think that one could reasonably be repaired.  
24 Some of the others, especially the ones that - that were  
25 right near their FTP standards, those are gonna be

1       difficult. And that's - I don't care what set of cut-points  
2       you decide upon or a program decides upon, you're gonna see  
3       both ends of that spectrum.

4 CHAIR WEISSER: Well, it raises the question to me whether as a  
5       society we're better off investing resources to try to get  
6       at these marginal failures versus the focus of resources to  
7       get at the - that Honda. How much of the benefit in terms  
8       of emission reductions that you project that you'd get from  
9       these - this tightening comes from that Honda -

10 MR. HEIRIGS: Versus -

11 CHAIR WEISSER: - versus the 50 cars that fail by -

12 MR. HEIRIGS: Right.

13 CHAIR WEISSER: - a marginal amount.

14 MR. HEIRIGS: And any time you can capture either a few high-  
15       emitters, you're gonna do much better than if you're  
16       getting, you know, vehicles that are two or three times the  
17       standard. Although, even vehicles that are two to three  
18       times the standard likely have identifiable defects. It - a  
19       lot of times, and one of the reasons why I got up earlier  
20       and sort of this plea for more data is, you know, we don't  
21       know precisely. We're doing the best with the 500 or 600  
22       vehicles we have in the surveillance data, which is probably  
23       the best for this purpose in the world.

24 CHAIR WEISSER: Yeah.

1 MR. HEIRIGS: And in order to sort of sharpen your pencil more,  
2 you need to collect more data.

3 CHAIR WEISSER: Well -

4 MR. HEIRIGS: And I think that's something that the Air  
5 Resources Board is sort of committed to do in terms of  
6 analysis task that Ms. Morrow had presented earlier.

7 CHAIR WEISSER: Now, your projection of the emission reductions,  
8 obviously, would include the gross emitters that you catch -

9 MR. HEIRIGS: Right and that Honda -

10 CHAIR WEISSER: - but they would be caught anyhow by the existing  
11 system, wouldn't they?

12 MR. HEIRIGS: That Honda wouldn't have.

13 CHAIR WEISSER: Not necessarily?

14 MR. HEIRIGS: That Honda wouldn't have.

15 CHAIR WEISSER: That Honda would not have?

16 MR. HEIRIGS: Would not have. Right.

17 CHAIR WEISSER: Okay.

18 MR. HEIRIGS: Because that's -

19 CHAIR WEISSER: Can you -

20 MR. HEIRIGS: All that's on that list are vehicles that were  
21 capture with this new set of cut-points.

22 CHAIR WEISSER: Okay.

23 MR. HEIRIGS: That were not captured with the current cut-  
24 points.

1 CHAIR WEISSER: Do you know, or can we ask someone from the Air  
2 Resources Board, what happens now about the study was  
3 submitted in July, where do things stand? Tom?

4 MS. MORROW: Sylvia Morrow with the California Air Resources  
5 Board. We actually have not gotten to that step yet as far  
6 as deciding or requesting that BAR implement that - more  
7 stringent cut-points because there are some other issues  
8 with it.

9 CHAIR WEISSER: What other issues are there that we should be  
10 think of?

11 MS. MORROW: There were questions, if you look at the report, I  
12 believe there were questions of is the VID and being able to  
13 store those extra cut-points and things like that and as you  
14 know, right now, BAR is undergoing a change as far as their  
15 - a new contractor that is gonna be - that has redesigned  
16 the VID and it will have different capacities, so we just  
17 have not reached that point of deciding whether to go  
18 through with this or not.

19 CHAIR WEISSER: Well, that's a BAR implementation issue, but you  
20 haven't crossed the threshold of deciding whether or not  
21 you're gonna recommended heightening the cut-points, I  
22 presume regardless of BAR's transition challenges right now;  
23 is that correct?

24 MS. MORROW: That's correct.

25 CHAIR WEISSER: Why not?

1 MS. MORROW: I'd have to go check on that.

2 CHAIR WEISSER: Okay.

3 MS. MORROW: Okay.

4 CHAIR WEISSER: I'm just kinda curious as to where you stand. I  
5 once again want to get back to this notion of societal  
6 resources, you're talking \$7,500 a ton, which is, you know,  
7 I think pretty much in the ball park in terms of relative  
8 cost-effectiveness. It's pretty good these days. But, as a  
9 society, would we be better spending that on this versus  
10 increased scrapage or you know, what other program options  
11 there are, I don't know. And I don't have any further  
12 questions. So, any others from the Committee? Are there  
13 questions from the public? Mr. Peters?

14 MR. PETERS: Mr. Chairman and Committee, my name is Charlie  
15 Peters, Clean Air Performance Professionals, a group of  
16 motorists that are interested in these issues. A lot of  
17 very interesting information. We have supported cars'  
18 specific cut-points to make the program as fair as possible  
19 to eliminate false failures and false passes for decades.  
20 In addition to that, and so, that review and those  
21 possibilities I think are very important. The comments by  
22 Committee Member Nickey, I think are very appropriate  
23 looking at significant potential emissions generating from  
24 other systems that are not measured by the tailpipe test and  
25 however, there may be some subject matter here that's not

1 being discussed that you certainly brought out that may add  
2 some additional fuel to your consideration and that is all  
3 of this data is comparing the standard that the car is  
4 required to meet when it's manufactured, which, if a very  
5 small percentage of the cars fall out of - fall below that  
6 standard, the whole fleet has to be recalled, so the actual  
7 amount of emissions from the fleet of cars may very well be  
8 considerably less than what is being used as a basis for  
9 this discussion. And you have a huge amount of vehicles  
10 which are being possibly brought in to compliance with the  
11 tailpipe emission standard where, if in fact, the car - what  
12 was actually wrong with the car was repaired, it may very  
13 well take a very significant amount of those cars which were  
14 marginal failures and move them into the dynamite emissions  
15 responsibility range and a proved oversight would eliminate  
16 half of the fleet emissions in a year, which could make this  
17 discussion of the minutia here quite important. But the  
18 issue of utilizing what's between the ears of the people  
19 that do this job in this State and supporting them to  
20 actually fix what's broken might make a much bigger  
21 improvement and solve your problem with the marginal failure  
22 that doesn't get improved or oftentimes gets worse by you  
23 and your friend from Nevada. So, I would suggest that you  
24 look at - take a possibility of taking a look at some  
25 additional data here, some additional support of finding out

1 if what's broken gets fixed and what kind of an effect that  
2 could have on the fleet and the industry and the State of  
3 California health.

4 CHAIR WEISSER: Thank you, Mr. Peters. Are there other comments  
5 from members of the audience? Thank you. People getting  
6 hungry? Well, how about one more discussion before lunch  
7 break. Is that okay? Because Jeffrey Williams has a  
8 discussion that is actually the item after what was next,  
9 but it's very closely related to what we're discussing now  
10 and I think if we hear Jeffrey, we accomplish two things; we  
11 get some connectivity between these two discussions and  
12 secondly, the lunch rush will have been over and we'll be  
13 able to speed through to our meal more efficiently. Is that  
14 okay with Members of the Committee?

15 - o0o -

16 MEMBER WILLIAMS: I've done a study of 1987 VW Golfs that I'd  
17 like to report, but my broader issue is really one of  
18 methodology. I'd like to make an argument on the importance  
19 of looking at the history of the vehicles, the individual  
20 cars, but also in this case, '87 Golfs. In contrast to the  
21 type of study reported upon, which we might call a cross-  
22 sectional study that doesn't think about the history. I'm  
23 not saying those aren't useful studies, I'm just arguing  
24 that the histories help. In the case of the comparison with  
25 Wisconsin, it might be helpful to have known what was the

1 failure rate on those Pontiacs two years before or the  
2 individual cars. It would help us understand a bit more  
3 what's going on. I'm using these Golfs as an example of  
4 this type of argument. When we've been talking so many  
5 months here, so many meetings, about such issues as do  
6 repairs last, are the vehicles repeatedly failing? Mr.  
7 Peters is always asking are the repairs working. That's  
8 really about the history of the vehicles, that is we should  
9 see the same vehicle repeatedly failing if the repairs  
10 aren't working. We might also want to evidence that the  
11 worse performing vehicles are the ones that are being  
12 scrapped. We need to know how they've done previously. And  
13 similarly, when we talk about cut-points we are really  
14 asking if they are the ones that are going to affect the  
15 future fleet. They might be retire - a car that fails there  
16 might be retired. So, I'm trying to make a methodological  
17 argument basically here, but I think you'll find the history  
18 of these 1987 Golfs intrinsically interesting. It's not  
19 quite what I expected and it makes a number of these issues  
20 look more complex than not, unfortunately. Before I look at  
21 the Golfs, though, I'd like to review some arguments on a  
22 more hypothetical level, and also to get you used to the  
23 types of diagrams I want to show you. I've made up some  
24 data here for 20 possible cars and how they've done on the  
25 high-speed mode of the ASM test. Looking at the hydrocarbon

1 parts per million on the vertical access and the NOX parts  
2 per million at the horizontal access and I've made up some  
3 cut-points, so that the ones that are within the box have  
4 passed this test and the red dots up at the top have failed  
5 this test. So, green is to be passed and red is to be  
6 failure. And I - and that's the typical cross-sectional  
7 analysis. This is a 30 percent fail rate. But what's  
8 interesting, I would argue, is what happens in these tests,  
9 and so let's go through a couple scenarios. Well, maybe  
10 first we should say let's keep track of another group of  
11 cars. The yellow ones where we might have higher cut-points  
12 - or excuse me, lower cut-points. We're gonna keep track of  
13 these three colors and what does their history say in the  
14 future. First of all, those red dots have to be repaired.  
15 They're not legal because they failed their Smog Check.  
16 What might happen to them? Well, one might be officially  
17 retired, agreed it's not worth repairing this car, DMV is  
18 told that it is junked. Well, other ones might be repaired  
19 and some might be repaired better than others or at least  
20 get a lower score. The question will be are those better  
21 repaired so I have two yellow-red dots here, which are ones  
22 that have been repaired, but their NOX and hydrocarbon  
23 scores are still fairly high. Well, we have three green  
24 dots. So there are 19 vehicles remaining. What happens at  
25 their next biennial test? I will first show you what we

1 might call the rosy scenario, or at least one where there's  
2 a clear-policy analysis, and then I'm going to show one that  
3 isn't that. Let's look at the rosy one first. Three - two  
4 more cars have exited this fleet, one of them a green dot,  
5 that's what it was the first test, has been involved in some  
6 accident and was scrapped. But (sotto voce) - something  
7 like that. And we find a yellow one also was officially  
8 retired. That is the second test, the second cycle test was  
9 never done. Notice I've put most of the yellow dots, those  
10 yellow on the first cycle are now showing what would be in  
11 the failure range, so including one of the cars that was  
12 only slightly repaired so that red-yellow dot is up there.  
13 This is a case where if we'd had - more stringent cut-  
14 points, we might have gotten a lot of these cars out. It's  
15 pretty clear that these are repeated failures. The policy  
16 implication is fairly clear that we might have wanted those  
17 more stringent cut-points. Does everybody follow how my  
18 diagram is working and the colors? Well, if so, let's look  
19 at the same test results for the 20 - for the fleet of 20  
20 cars, but a very different scenario. In this case, there's  
21 still three cars that have exited the fleet. The one that  
22 has the black and red, that was a failure in the first  
23 cycle, has had no subsequent Smog Checks and the suspicion  
24 is it's on the road or not being used, where the green one  
25 that before was - no subsequent Smog Checks, has been

1 retired officially, as one that looked to have been fixed  
2 quite well, which is that green-red dot. And meanwhile, up  
3 in the right-hand corner where all the failures this cycle  
4 are, are primarily green dots, something happened in the  
5 car, where most of the yellow dots before are now in the  
6 easy-pass, which might be that this was just the effect of  
7 the fast-pass algorithm and they were actually much better  
8 cars all along and the next time that they're examined,  
9 which took two years, they passed easily. These are the  
10 same test scores the second time in each of my scenarios,  
11 but it should be clear that the history, what happened the  
12 time before, really alters our interpretation of what to do  
13 about this program, whether just tighten the cut-points and  
14 deem whether we're spending our money on repairs very well,  
15 whether we should have fast-pass. All those issues are  
16 effected here. This is a hypothetical. What will be more  
17 interesting is what happens with this sample of '87 VW  
18 Golfs. I don't think it will surprise you that the  
19 interpretation is going to be someplace in the middle of  
20 these two things, which is a little discouraging. Let me  
21 explain my sample of '87 VW Golfs. I've identified them by  
22 the VIN and sorted them chronologically. I didn't go  
23 through the data to find where someone said it was an '87 VW  
24 Golf, but I used the VIN to identify them. That's more  
25 accurate in theory. And I applied this standard; that there

1 must be at least one ASM test for the Golfs, actually I have  
2 4,300 VW Golfs in this - in the entire dataset that I have,  
3 but I've asked that a Golf have to have a ASM test between  
4 October 1<sup>st</sup>, 2000, and September 30, 2001. I'm imagining  
5 that most of these are the biennial test. An '87 Golf  
6 should have been bought how many years before over that  
7 period. We might just think of these as the 2001 test for  
8 the '87 Golfs, they're 14 years old.

9 MALE: (Inaudible)

10 MEMBER WILLIAMS: No, my entire sample covers all tests from  
11 January 1, 2000, through September 2005. So I have the  
12 potential here to track these cars through three biennial  
13 tests, and that's what I'm really trying to do and, indeed,  
14 I have done that. As you can see on my list, I'm looking -  
15 I'm recording if there're further ASM tests done, as long as  
16 they're done at least a year ahead or three years ahead.  
17 There'll be some change of ownership tests here. But most  
18 of them are three cycles of biennial tests. And in each  
19 biennial test cycle, I potentially am recording to examine  
20 two tests. If the car failed, I ought to find another test.  
21 In this, I've ignored the aborted tests, I think that's an  
22 important issue. I've argued about that before, but I  
23 though that was a little too complicated. I've also  
24 required that there be hydrocarbon and NOX numbers for these  
25 tests. A few of them are missing for some reason, but most

1 interesting for our purposes is that with Rocky's help, I've  
2 looked into the DMV records of these Golfs. In fact, of the  
3 4,300 Golfs, we've put the VIN through DMV and come back  
4 with what's happened to these Golfs. And there is various  
5 complicated coding that I've learned to understand. I'm  
6 willing to summarize all that with saying that they've been  
7 officially retired and not distinguish among whether they've  
8 been junked or non-opt, whether they've been in the salvage  
9 category or they went out of state, which a few did. I've  
10 noticed - I'll say in passing that there are many of these  
11 vehicles have been non-op'd and then junked, so there're  
12 actually two records. That's probably worth studying  
13 itself. I'm just gonna tell you whether we have found them  
14 officially retired or not. All right. What happens with  
15 these Golfs? Hope everybody understands, I have 928 VW  
16 Golfs that had an ASM test sometime in this per - let's call  
17 it 2001 and it's the first - I'm gonna show you first of all  
18 the first test scores on these Golfs. So, that could be a  
19 pre-test under some circumstances. And I understand this is  
20 a normal reckoning that BAR and ARB has done about the  
21 typical pass-fail rate. Here are these Golfs. Oops, excuse  
22 me. I'm forgetting, I need to tell you a little more about  
23 the data, just so you understand. This is a particular  
24 Golf, California plate 2GKM228, whose registration is  
25 current through September 26, 2006. This Golf resides in

1 Davis, California. Why did I pick Golfs? I own one. I  
2 own that car. And there are four records in the large  
3 datasets I have and I'm gonna show you a little example of  
4 this so you can understand what I'm looking at. Do you see  
5 that there's a date in about the - 1/3 over. So this  
6 particular Golf on the 2<sup>nd</sup> of October, 2001, at 11:08 in the  
7 morning had a Q-test, see that Q there, that's a pre-test,  
8 at Station RA-214615, which is a test-and-repair station in  
9 Davis. I didn't even know of the test-only and I took it to  
10 my regular repairman, who evidently, did this test on it. I  
11 don't even know that. Three days later, I took that car to  
12 a test-only shop in Sacramento, that's the 5<sup>th</sup> of October.  
13 You can see what the mileage was over that three days. It  
14 went from 119965 to 120026, and you'll see my test results  
15 there. But along the way, you'll see something odd. See  
16 the column that says QCPP? That C means change of  
17 ownership, which it was not, which is now giving me a lot of  
18 worry about all the analysis that we're doing about whether  
19 cars are directed or not. Well, it's supposedly in the  
20 algorithm that converts these tests. The P means directed.  
21 This car has been directed three times, actually. We have  
22 four test records. The last string of numbers are the  
23 hydrocarbon, carbon monoxide, and NOX, so 0053 is, in that  
24 pre-test, the hydrocarbons for this Golf and it's NOX is  
25 605. I'm going to show these numbers a lot. I'm not going

1 to show the carbon monoxide in the middle. I note in  
2 passing that these two tests done two days apart, the  
3 hydrocarbons went from 53 to 101 and the NOX from 605 to  
4 599. There's some evidence right in there about how  
5 reliable or how consistent are our test results. Maybe  
6 pretests are worth studying from that perspective and so  
7 forth. This car passed all four tests, which is that final  
8 P on the high speed and it passed all the others, too. So  
9 for every Golf that, in my sample, the 922, I have these  
10 records. In some case, 10 or 15 records, in some cases only  
11 one, but a minimum of one. We're going to follow their  
12 chronology. This car, however, is not in the sample. Why?  
13 Because although the inspection certificate and registration  
14 was due on September 26, 2001, its owner didn't get around  
15 to doing this until October, and it missed the September  
16 30<sup>th</sup> cut-off. You might notice that in 2003 the owner  
17 waited even longer until the 21<sup>st</sup> of October. That was  
18 because an IMRC meeting was coming the next day and he was  
19 feeling guilty. And so why did he do it in July of this  
20 year? That's because his headlight had been bashed out and  
21 he'd procrastinated doing that for so long that the new test  
22 requirement had appeared in the mail. And so he managed to  
23 look like he was ahead of it, instead of behind. But I  
24 wasn't. Okay. I'm going to show you 922 dots, the first  
25 test results. I think you can see where the cut-points are

1 for these VW Golfs, right? The green lines, green is it  
2 passed the whole test. How do I have red dots in the middle  
3 of the green? Well, this is because I'm showing if the car  
4 failed the entire test, so this is the high speed part of  
5 the test. About 15 of these Golfs were tampered with and so  
6 they automatically failed. Notice that there are a lot of  
7 red dots. There are 313 failures out of 922, which is a 35  
8 percent failure rate, which is a very high one. It's not  
9 surprising that '87 VW Golfs go through the high-emitter  
10 profile and every one of them gets directed in the  
11 subsequent years. These cars are polluting a lot, with one  
12 notable exception at least, not due to any careful  
13 maintenance, I assure you. Some of these cars are really  
14 polluting a lot. Notice the three dots way above 400 on the  
15 hydrocarbon. I had to change those numbers to have the  
16 scale that is visible, one is 3,000 and something.

17 MALE: A dead misfire.

18 MEMBER WILLIAMS: Unless, I guess it comes out richer when it  
19 goes out, right?

20 MALE: It's a dead misfire. Hydrocarbon's unburned gasoline.  
21 It's a dead misfire.

22 MEMBER WILLIAMS: It's just incredible, right. There are three  
23 of those, about 100 of these are gross polluters. It's  
24 amazing, right? It's also pretty - not clear where you  
25 would draw a line saying let's tighten these cut-points

1       because there's an intermediate group, right. But I'm gonna  
2       try that anyway. I've consolidated this picture just to  
3       make the scale a little easier for us and I'm going to  
4       distinguish yellow now, which were greens that passed, but  
5       pretty close to the cut-point.

6 MEMBER DECOTA: Now what if the reds and greens are failures,  
7       one-time failures?

8 MALE: (inaudible).

9 MEMBER WILLIAMS: This is another portion of the test - failed,  
10      right.

11 MEMBER DECOTA: Okay.

12 MEMBER WILLIAMS: So I'm gonna keep track of these three colors  
13      and some of you might say well, how do you decide that a  
14      green that's almost on the line with the yellow isn't say,  
15      what's green and yellow, aqua? Well, yeah, I agree and how  
16      about the reds that are almost yellows? Shouldn't they be  
17      orange or something, I agree. I'm making three distinctions  
18      here where most of the time we don't even trace the  
19      histories at all and three colors was about beyond me. Mr.  
20      Peters, you have a question? I don't want anybody -

21 MR. PETERS: Yes. The red dots in that picture are false-  
22      failures because they failed visual or functional, is that -

23 MEMBER WILLIAMS: No, I'm saying they're false-failures at all.  
24      They were failed -

1 MR. PETERS: They were failed but they passed the emissions  
2 portion of the test?

3 MEMBER WILLIAMS: They passed the high-speed hydrocarbon and NOX  
4 portions of the test.

5 MR. PETERS: But they might have failed the idle -

6 MEMBER WILLIAMS: They might have failed the low -

7 MR. PETERS: Or the lower speed.

8 MEMBER WILLIAMS: Or the lower speed or the visual and all that.  
9 Some were tampered with.

10 MR. PETERS: So some of those in that smaller section actually  
11 failed the test - the red ones failed the test but that was  
12 because of a reason that - in addition to the high-speed  
13 portion.

14 MEMBER WILLIAMS: Yes. And that's already interesting, although  
15 I did relate the high-speed results, like for NOX, with the  
16 low-speed results and the correlations about .9. All right.  
17 We're gonna follow these 922 cars and see what happens to  
18 them. The first thing is that the red ones should have been  
19 repaired. I'm gonna make a window that says they had to be  
20 repaired within 60 days. Most are repaired within the next  
21 couple days. So now we start to see what the history  
22 matters. So here is what happens to the red ones. There  
23 should be yellow and green still there, but I thought we  
24 were getting a little crowded, right. So what are the red-  
25 yellow dots, those are ones that repaired and just passed,

1 but there are a lot of green-red dots, which means they were  
2 apparently repaired quite well or they got lucky on a  
3 reading or something like that. What I found most  
4 surprising about this was that of the 313 cars, 84 fell out  
5 immediately because they failed that test and I don't think  
6 we've been talking about that very much, so that initial  
7 test makes a lot of people say time to junk this car. The  
8 majority of those were officially junked, which is the  
9 little red-black, black dots which retired officially.  
10 There are 31 for which I have no subsequent records in the  
11 Smog Check data.

12 MALE: And those are not just subsequent records anymore. This  
13 year, but you're saying through 2005 -

14 MEMBER WILLIAMS: Yes.

15 MALE: They've never reappeared.

16 MEMBER WILLIAMS: They have never reappeared.

17 FEMALE: (inaudible).

18 MEMBER WILLIAMS: Yeah, I don't what happened to them. We're  
19 gonna -

20 MALE: They're out in Rio Linda up on blocks.

21 MALE: Excuse me, was the registration checked on it? Did they  
22 - although they didn't get any smog checks, were they  
23 registered?

24 MEMBER WILLIAMS: They were registered, they didn't pass the  
25 smog.

1 MALE: Cars are registered all the time that don't pass smog.

2 I'm just wondering if there was an indication that there was  
3 any illegality going on, if the DMV was checked on it.

4 MEMBER WILLIAMS: I didn't systematically study that, I have  
5 those data, and so I will.

6 MALE: That's making the history of the DMV and fine, all right.

7 Let's move on. Think of two years have passed that these  
8 922 cars are being thought about. What's hap - let's trace  
9 them a bit. We have 427 greens, 188 yellows, 53 red-  
10 yellows, 176 red-greens and 84 are already gone, so I'm now  
11 going to show you the test results on a cycle next. We'd  
12 like to see, right, a lot of the greens still green. If a  
13 lot of the yellows end up where the reds should be, then  
14 we've got a problem, right, or an opportunity to tighten the  
15 cut-points. Okay, here it is. I invite you to study this.  
16 One thing I'll hint at. Do you notice that the cut-points  
17 got tightened by 2003 for this type of car where all the  
18 little, on the note, my little line is the previous cut-  
19 points? You see all the little green dots that are at 130,  
20 that was a tightened cut-point.

21 MALE: They only tightened NOX, isn't that right?

22 MEMBER WILLIAMS: The hydrocarbons. Okay. So, where are the  
23 green dots? Well, they're partly in passing again, but some  
24 have failed. A lot of the yellow dots moved into the  
25 failure range, but I find the striking thing about this

1 diagram to be in the right most part of it. Most of these  
2 cars are gone.

3 MALE: They're gone without a certain pattern of pass or fail.

4 MEMBER WILLIAMS: Some of them - yes, we got a lot of green ones  
5 that just disappeared now. Some of the green ones were  
6 officially retired. Wow. A lot of cars are going. That's  
7 giving -

8 FEMALE: People are leaving California.

9 MEMBER WILLIAMS: Or they leaving California, all that. Let's  
10 summarize this, though. The failure rates in the second  
11 cycle by the color code of those that had the test. The  
12 red-yellow was 43 percent, red-green 36, yellow, 50, and  
13 green 26, which is a suggestion that the cars didn't fully  
14 get repaired or there's a problem with them. But wait on,  
15 because we have another test cycle. And here's by the third  
16 one. So this is the color and the first test cycle. I  
17 could update colors, so green-green and what happened to it;  
18 green-red, what happened to it, I - that was beyond my  
19 ability to do the colors. I've made a second column of the  
20 cars that have disappeared, retired, whatever, in the time  
21 between 2003 and 2005. There are only 225 VW Golfs of the  
22 922 left in six years.

23 MALE: I'm not surprised.

24 MEMBER WILLIAMS: I'm not surprised either. I'm hopeful it  
25 might be worth something above zero in a couple more years,

1 the one I own, right, at the current rate. There are - of  
2 the 4,300, I can find someplace in the DMV database, we're  
3 down to 1,010 registered as of January 1, 2006. These cars  
4 are going, right?

5 MALE: (overlapping) for parts, Jeffrey?

6 MALE: Question, I looked at the non-retired and in-use yellows  
7 and I don't see any pattern -

8 MEMBER WILLIAMS: I don't either.

9 MALE: - which makes me - I think that's some implication on the  
10 cut-point -

11 MEMBER WILLIAMS: Yes, it does. It's only VW Golfs, but it's a  
12 small sample, but yeah, it's not clear that the yellow ones  
13 - this is - two test cycles later are looking all that  
14 different from the green ones and indeed two cycles in most  
15 things are looking the same. The failure rates in the third  
16 cycle, the red-yellows 25, red-green 23, yellow 24, green  
17 24. At this point, it's random from what it was two years  
18 before. Now, I should show you what it was just four years  
19 before - I should show you two years before, I think we'd  
20 see stronger patterns by the updated color, if you will. We  
21 did see that, but we have - history matters, but at some  
22 point the history is irrelevant. What these cars in 2005  
23 experienced in their 1998 test is probably not relevant  
24 anymore, but what happened in 2003 is, right? Here's  
25 another way to look at this though, that is a little more

1        perplexing. When we looked at those tests in 2001, there  
2        was a 34 - 35 percent failure rate. 2003, 27 - 24 in 2005.  
3        How is that possible? These cars are getting older, they  
4        ought to fail more.

5 MALE: The strong survive.

6 MEMBER WILLIAMS: The strong survive or the ones that weren't  
7        driven very much survive because the ones in 2005 had way  
8        below average mileage in 2001, right?

9 MALE: Right.

10 MEMBER WILLIAMS: Not surprisingly, right?

11 MEMBER LAMARE: Did you have the - are you saying you had the  
12        mileage?

13 MEMBER WILLIAMS: I had the mileage, apart from the fact that  
14        about 1 in 10 VW Golfs has its odometer freeze or spin. If  
15        we take that problem out, I know one that had that, there  
16        are at least 30 of the surviving cars that had the same  
17        odometer reading in all three tests, and I don't think - I  
18        know they had to drive to the test center, right? So  
19        there's a problem there. There's a couple that have spun up  
20        to 99999, but if I take - that's why I take the median, I  
21        take those out. The cars that aren't driven very much are  
22        the ones surviving. Well, but this means that the failure  
23        rate is a function of the whole profile of this make and  
24        this is why I was asking a bit about Wisconsin versus  
25        Arizona. Let's imagine that cars don't last very long in

1 Wisconsin because of some other reasons such as salt. The  
2 ones that survive in Wisconsin are - the equiv - only 14  
3 years in Wisconsin are probably the equivalent of an 18-  
4 year-old car in California and there ought to be a different  
5 failure rate because of the survivorship problem. I'm a  
6 little - we have to think not only of the history of the  
7 individual vehicles, but of the whole make and its profile.  
8 I think implicitly we've been saying the retirements is a  
9 fairly constant proportion of the fleet, it isn't and once  
10 you think about it, of course, it isn't. These Golfs are  
11 coming to the end of their useful lives. It's amazing that  
12 anybody keeps them and on it goes, right?

13 MALE: Well, I think we need to emphasize that a 25 percent  
14 failure rate with the cut-points, frankly pretty low, is  
15 nothing to be proud of.

16 MEMBER WILLIAMS: No. I think the bet - and so that gets to a  
17 final point. What is the main effect of the Smog Check  
18 program? It's for - it's retirement. It's forcing a lot of  
19 cars out, particularly VW Golfs, and that's probably a  
20 really good thing.

21 FEMALE: A good thing.

22 MALE: That is a good thing.

23 MEMBER WILLIAMS: It's a really good thing. And that gets back  
24 to what's the benefit of this program, this model - well,  
25 that car is replaced by some eight-year-old cars, something

1       like that. I think we really want to look at those model  
2       assumptions in (unclear) because that's a major effect of  
3       this program. At least for these elderly cars, like a VW  
4       Golf. Let me look at it though, from a slightly different  
5       way. Of the original 922, only 218 are registered. Of the  
6       225, 7 didn't get the final. Of the failures that weren't  
7       done, they're only 218 left. Of the original 313 failures,  
8       only 52 remain, which is a 17 percent survival rate. Of the  
9       yellows, 24 and the greens 28. That's intuitive -

10    MALE: And the mileage.

11    MEMBER WILLIAMS: And the mileage and all that is the same  
12       thing. But once we start thinking about the history of  
13       these cars and the history of the group of cars, we start  
14       realizing that imposes some different perspectives on the  
15       program. I think we need to think about it this way. As I  
16       say, my point is mostly methodological. I don't think  
17       anyone's going to argue with me that it's better to use this  
18       information about the history of the vehicles themselves. I  
19       don't find glaring evidence that cars are just being fixed  
20       for a day. A lot of these repairs seem to be lasting, but  
21       there's some evidence that some are being fixed for a day.  
22       I think we really wanna look at the reasons for the failure.  
23       I just made everything a red dot and whether it was a  
24       failure on the functional test or a gross polluter on this  
25       high-speed test, it probably is very different and the same

1 way I think we can learn a lot about what's going about  
2 fast-pass from looking at the pretest and the next test and  
3 that's a new idea for me. I encourage everybody to do the  
4 history of these tests, but my goodness, getting the dataset  
5 organized like this was a lot of work. I own a VW Golf, so  
6 out of 70 million records, but I have the potential to do  
7 more. It takes a lot to match up all this so when everybody  
8 is saying that it's a low to moderate analyst expenditure  
9 time, I'm not sure about that. I'll take some questions.

10 CHAIR WEISSER: My first question is did you succeed in burning  
11 through one or two PCs on this?

12 MEMBER WILLIAMS: Yes.

13 CHAIR WEISSER: Well, I - this isn't so much a question as a  
14 comment, which is the method of you presenting this  
15 information is really illuminating and easy for us to  
16 understand, easier sometimes than other systems that I've  
17 seen put forward for data and I'm very thankful of this. I,  
18 on the one hand, want to compliment you and on the other  
19 hand want to curse you because I think you have confused the  
20 situation. I think some of my assumptions now, I'm gonna  
21 have to step back a bit. And, in particular, the numbers  
22 on, as you were saying, the cars on the far right, those  
23 that are officially retired or that have disappeared from  
24 the system seems to be the biggest impact. Anyhow,  
25 questions from Members of the Committee. We'll start from

1 the far right. Mr. Pearman, do you have any further? Mr.  
2 DeCota?

3 MEMBER DECOTA: The amount of vehicles that passed at the end of  
4 the five years, the 54 vehicles, would it be possible to  
5 track them to get their maintenance history or some kind of  
6 an idea of how those cars were maintained over that period  
7 of time?

8 MEMBER WILLIAMS: I don't know.

9 MEMBER DECOTA: On the test that was done on your VW that you  
10 did not order, that showed up on the record, right -

11 MEMBER DECOTA: It was probably a repair that he used his  
12 testing equipment to verify that the emission levels were  
13 satisfactory and never reported it to the owner. You know,  
14 it's used every day as a tool. So that may be, I don't  
15 know. I mean, that may be, because I'll bet you brought on  
16 a performance issue, you brought it in for repair or service  
17 or something and had an issue with regards to performance,  
18 so that's how that could compile, which bothers me because  
19 it could really skew the information that we're getting on  
20 high-emitter profiles and that type of thing. Okay. The  
21 industry could be actually hanging itself out to dry on this  
22 stuff.

23 CHAIR WEISSER: Okay. Very interesting. We'll proceed, then.

24 John, do you have something? Paul, you've been very, very  
25 quiet today. Very good. Please.

1 MEMBER ARNEY: Is there any possibility that it's not just  
2 coincidental that these vehicles have disappeared out of the  
3 system, that they're - I mean, they're very old. Is there  
4 any possibility that maybe they're just not worth keeping on  
5 the road anymore and - and that's not - doesn't have much to  
6 do with passing the Smog Test? Just a thought.

7 MEMBER WILLIAMS: Well, most of them are disappearing unrelated  
8 to the Smog Check history. They're just going, right?

9 CHAIR WEISSER: Well, I don't - don't look at me. The question,  
10 Paul, as I understand what you were saying is do they -

11 MEMBER ARNEY: Well, are they off the road because we've  
12 tightened the standards or are they off the road because  
13 they're just junk?

14 MEMBER WILLIAMS: I would say there's some evidence there that  
15 the standards themselves are forcing people to say, time to  
16 say goodbye to this car. But these cars are going anyway,  
17 and I'll confirm that with one story. Why do I have a VW  
18 Golf still?

19 MEMBER ARNEY: That was my next question.

20 MEMBER WILLIAMS: I went in 1999, six years ago to buy a Jetta,  
21 the same dealer I bought the Golf from and when I first came  
22 to California in 1987, and we negotiated the price for that  
23 new Jetta and I finally said well, what will you take for my  
24 - you know, how much will you give me for my Golf, they

1       said, we're not even gonna bother to help arrange for you to  
2       send it to scrap. This thing is a piece of -

3 MEMBER ARNEY: Yeah.

4 MEMBER WILLIAMS: And so I owned two cars suddenly, right? And  
5       so I was - he told me about giving it to charity and so on.  
6       I brought it home and was thinking about how to do that and  
7       called up my insurance company to say about the new car and  
8       the agent said, so are you keeping your old one? Well, I  
9       said, for the moment, but not very long. He said, well,  
10      we'll charge \$1,000 for your Jetta, but if you have the  
11      Jetta and the Golf, we'll charge you \$850. And I said,  
12      would you run that one by me again, please. It turns out  
13      that that's the regulations in the State of California.  
14      They somehow imagine I'm using both cars. Since the  
15      registration fee was \$50 for the Golf, I was ahead, so I  
16      kept the car. I've since gotten used to having two cars and  
17      all that, but by all standards, its value was zero in 1999.

18 CHAIR WEISSER: Now you have a front lawn ornament.

19 MEMBER WILLIAMS: Yeah, you know it was being used, it's got  
20      (unclear) miles on it.

21 CHAIR WEISSER: Oh, that's not bad. Okay. Roger, do you have  
22      anything?

23 MEMBER NICKEY: Fascinating.

24 CHAIR WEISSER: It really is.

25 MEMBER NICKEY: I was just -

1 CHAIR WEISSER: Really is. Jude?

2 MEMBER LAMARE: No, I still need to absorb. One of the  
3 difficulties I'm having is I think of I would like to see  
4 just the greens and the reds and forget about the yellows  
5 for a while and see how that plays out and then - then put  
6 the yellows in, so I'd like - I'll just sit down with this -

7 CHAIR WEISSER: I think the migration of the yellows in  
8 basically a random pattern is pretty darn interesting in  
9 terms of the notion of tightening the cut-points. However,  
10 the benefits from tightening the cut-points have, in this  
11 particular instance, have little to do with the emission  
12 reductions, but have a lot to do with the retirement, so  
13 maybe we should make them really tighter.

14 MEMBER LAMARE: I'd like to look at that more and the fact is  
15 that 50 percent of the yellows failed in the second cycle  
16 and there were emission reduction gains from getting them  
17 fixed and so -

18 CHAIR WEISSER: Do you have a color copy of this that - could  
19 you get us color copies of this? I want to show this to my  
20 - to my guys, because I think it's really interesting.

21 MEMBER LAMARE: So, we want to think through this, because  
22 there's a lot of really interesting information here.

23 CHAIR WEISSER: Okay.

24 MEMBER LAMARE: Thank you, Jeffrey for putting in all that time.

1 CHAIR WEISSER: Well, let's open up to some questions before  
2 hypoglycemia sets in to the crowd as a whole. Bud?

3 MR. RICE: Hi, Bud Rice, Quality Tune-Up shops. Just a quick  
4 question. If - if you tie a ribbon around that group of  
5 people, is there a way to watch what happens next? In other  
6 words, if you had a Golf and now they don't. So what  
7 happens next, is kind of an interesting thing. Did they  
8 retire that car and then get a 1995 car in exchange? And if  
9 that's true, there has to be some effect on the air, I would  
10 think, by getting rid of that Golf and picking up this car  
11 in exchange. Thank you.

12 MEMBER WILLIAMS: I can do that, but I haven't. Remember, I  
13 have all DMV registrations as of January 1, 2005, and I know  
14 who was the legal owner of these cars in 2000, so let's see  
15 what they bought.

16 CHAIR WEISSER: Well, I think it's a real interesting question  
17 because there are, you know, a certain amount of credit is  
18 taken in the SIP for retirement systems and the like based  
19 upon projections about the nature - how many years newer a  
20 vehicle are people getting. And there have been studies.  
21 I'm assuming those numbers aren't plucked out of thin air.  
22 I just don't - I have not seen the studies, but I've been  
23 told that there are studies, but I think you're raising a  
24 good question. It's not merely how much newer a car, but  
25 it's also what kind of a car. You had the drag racing king

1       here with his Golf, they might get something really  
2       efficient. Mr. Cackette, please.

3 MR. CACKETTE: Yeah, we've done a study on the - what happens to  
4       the cars that are scrapped in the BAR scrap program and the  
5       people, most of the people buy a new car and it's typically  
6       eight years newer, so it does tend to have lower emissions.  
7       Eight-year-new cars get driven more than eight-year-older  
8       cars, so there's somewhat of an offset there. There's a few  
9       percent, you know, that don't buy new cars, take the bus or  
10      whatever, but most of them buy, on average, an eight-year-  
11      newer vehicle. You know, and we'll give you \$1,000 bucks  
12      for that car, you know. You just have to fail the Smog  
13      Check and there's a check in your pocket.

14 CHAIR WEISSER: We can arrange that easily. There's the guy to  
15      my right and a guy to your left.

16 MALE: Bring it over for a test. We'll take care of it.

17 CHAIR WEISSER: Bring it to the community colleges, they'll take  
18      care of it.

19 MR. NOBRIGA: They don't want them. Larry Nobriga, Automotive  
20      Service Councils of California. A question that comes to  
21      mind on your right column, all of the greens that got  
22      officially retired, they could not be part of the BAR  
23      scrapping program because they had to fail the test. How  
24      many of those might have come from the various air  
25      management district scrapping programs where they just mail

1 out a letter and say we'll give you \$500 bucks or whatever  
2 for your 1980 automobile?

3 MEMBER WILLIAMS: I don't know, but I think we could trace that  
4 through. I just summarized all the DMV data into was it  
5 official or not, because I thought it was interesting how  
6 many there's no official record of, but I didn't track the  
7 category that is junk versus non-repairable junk, which I  
8 think are almost always those official retirement programs.

9 MALE: (inaudible)

10 CHAIR WEISSER: Any other questions? Okay. How many people  
11 would like to take a lunch break? Okay. I know we have a -  
12 I just want to apologize to - who am I apologize to this  
13 time? Mike McCarthy who is going to be chatting about OBD  
14 II, is it okay if we don't and you get up there, people are  
15 going to start throwing rocks at you so, it's five to 1:00,  
16 can we get back at a quarter to 2:00? Okay, so it's giving  
17 you 50 minutes for lunch. We're gonna start at a quarter to  
18 2:00. Thank you.

19 - o0o -

20 CHAIR WEISSER: Okay, ladies and gentlemen, if I could ask you  
21 to take your seats, we will reconvene the session. Thank  
22 you. I hope everyone enjoyed as delightful a lunch as I  
23 did. So, right now, we're gonna hear Mike McCarthy, Mike,  
24 chat with us about OBD II.

1 MR. MCCARTHY: Good afternoon. I'm Mike McCarthy with the  
2 California Air Resources Board. While Rocky's pulling up my  
3 presentation here, I'll just - like Phil, I've never been  
4 here before so I'll introduce myself. I've worked for the  
5 Air Resources Board for going on over 13 years, 12 of them  
6 have been involved in OBD II, specifically. So, you won't  
7 find too many people that have been working on OBD II that  
8 long. I'm a manager of the Advanced Engineering Section.  
9 My section has responsibility for the entire OBD II program.  
10 Everything from the regulatory side of it, writing the  
11 regulation, updating the regulation, to doing certification  
12 each year, and doing enforcement testing of the OBD II  
13 system. So, when it comes to OBD, it does come through my  
14 section at some point. Okay, so I wanted to give you a  
15 little presentation today just to give you a little update  
16 on OBD and also I wanted to respond to some things that -  
17 like I said, give you a little update on the program, some  
18 findings that we've had, some studies that are ongoing and  
19 also to give you some counterpoints to a presentation you  
20 previously had from Doug Lawson. At the end of it, I'll  
21 have a little bit on a continued study that we're doing,  
22 again looking into OBD and how it's working and what's going  
23 in the field. I think this probably goes without saying but  
24 I sometimes like to reiterate it. I hear it rephrased and  
25 paraphrased many different ways, but the OBD philosophy is

1 different from a tailpipe test and I/M scenario. An I/M  
2 scenario, we originally envisioned was just to try to catch  
3 the highest polluters, skim those off the top and OBD kind  
4 of changed that and went after actually finding broken  
5 components on a car and giving a mechanic an ability to go  
6 actually figure out what's wrong. As car were continuing to  
7 get increasingly complex, we noticed mechanics struggling to  
8 figure out what was wrong, we were struggling to figure out  
9 what was wrong. The manufacturers changed things as fast as  
10 they could and you couldn't get service information to stay  
11 pace with it or anything and so we - we focused on trying to  
12 make cars repairable. And we sort of have two categories of  
13 things in OBD; we have major emission controls, like the  
14 catalysts, and they're actually monitored to an emission  
15 threshold. When they deteriorate to the point that they  
16 exceed a certain tailpipe level, the OBD system is designed  
17 to detect that. For most of the other components on the  
18 car, we're looking for obvious failures: open circuits,  
19 shorts, rationality failures where the sensor is telling you  
20 a value that doesn't make sense at all for that sensor.  
21 And, you know, we're trying to detect malfunctions before  
22 the vehicle becomes a gross emitter. If we wait until it  
23 has become a gross emitter, we've lost the battle. We've  
24 already lost those emissions out in the atmosphere. So, we  
25 want to detect things as they break, as they happen. And I

1 think that's an important thing that it is a little bit of a  
2 different philosophy than what we've had in the past. OBD  
3 II was implemental in 1996 model year. We actually phased  
4 in a little in California in '94 and '95, but it's a real  
5 handful of vehicles in that timeframe that are OBD II  
6 equipped. It went nationwide in 1996. There are over 120  
7 million cars in the U.S. operating on the roads. That  
8 doesn't even include Canada, which has had the OBD II system  
9 since 1997. And then other areas like Europe which have  
10 developed OBD regulations that are not too far off from  
11 ours. They are less - generally less stringent, but they  
12 are developed. Out far as Japan, many other countries have  
13 also incorporated OBD-type requirements. And one of the  
14 important aspects of OBD II is it wasn't something we could  
15 just adopt and walk away from. We get into the nitty gritty  
16 of the details of the car. How they work, how the control  
17 systems work, what the new emission control components are  
18 coming on so they can be monitored and diagnosed by  
19 technicians. So we routinely are in a biennial update cycle  
20 where we come back to the Air Resources Board, present an  
21 update to the regulation with amendments, new monitoring  
22 requirements, modified monitoring requirements, those kinds  
23 of things to make sure we are keeping pace with technology.  
24 We get a lot of feedback from the field. When we find  
25 things that don't work right or we go out and we get

1 something from the field how it could be better or what more  
2 information could be made available to a technician and  
3 we're actually in one of those biennial cycles right now.  
4 We're scheduled to be in front of the Board in April of this  
5 year to present an updated version, like we have, I said  
6 typically we do updates every couple years. One other  
7 little thing I wanted to hit with a just a common sort of  
8 misconception or sort of different way of paraphrasing of  
9 OBD II. People have struggled with how OBD measures  
10 emissions. It's not a - you know, and they don't understand  
11 how this OBD system - it's not a tailpipe analyzer sitting  
12 off-board that measures it. Emission levels are inferred  
13 based on other sense parameters and the car manufacturer  
14 will sit there in the emission lab before he builds a car  
15 and they will run emission tests and develop a correlation  
16 between other sense parameters and tailpipe emissions and  
17 then he'll set the calibration before they start building  
18 the cars. There is no magic tailpipe sensor in the car.  
19 And let me give you an example. Exhaust gas recirculation  
20 or EGR systems, some of you I know are very familiar, some  
21 others may not so much, but you circulate exhaust through  
22 the system to lower NOX emissions. A common failure mode of  
23 these is passageways get - start to get plugged, you can get  
24 less (recording ends) -

25 CHAIR WEISSER: Okay, now try it.

1 MR. MCCARTHY: Yeah, now I'm back. Okay. So as I said, a  
2 common emission control is the exhaust gas recirculation, or  
3 EGR, a common failure mode is the passageways start to get  
4 plugged up over time or coked up and you get less flow. As  
5 the flow goes down, usually NOX emissions will start to  
6 climb back up. So a car manufacturer, when they're  
7 designing a car, will gradually restrict the flow in the  
8 system and constrain it down and measure tailpipe emissions,  
9 and when he hits the point where he's reaching the tailpipe  
10 emission level, then he will correlate, say a pressure  
11 sensor on the vehicle to measure that amount of EGR flow.  
12 So now he's developed in the lab a correlation between the  
13 measured flow and the tailpipe level. So when he goes out  
14 in the field, the cars don't have a tailpipe sensor on them,  
15 but they have this pressure sensor and it can be calibrated  
16 to set up for that flow that translates to the emission  
17 rate. So everything's sort of - it's inferred,  
18 developed in the lab by the car manufacturer before the cars  
19 go into production. Again, that's for the major emission  
20 monitors. For many other components, there are short  
21 circuits that open and stuff like that. They don't  
22 calibrate those to emission threshold. The sensor's either  
23 open-circuit or it's not. A question we get asked a fair  
24 amount is how does ARB know that OBD II is working. We  
25 spend a substantial amount of time with this regulation. As

1 I said before, we kinda go up - we go back and update the  
2 Reg every two years. We spend a lot of time, my section and  
3 our lab, bringing vehicles in off the field. Every year,  
4 every vehicle has to be certified. A manufacturer has to  
5 come in with a description of his OBD II system and test  
6 results to back it up and we go through that and review it  
7 and look for - make sure it meets our requirements, ask  
8 questions about how it's working and verify that they are  
9 actually meeting our requirements. On top of that, we have  
10 testing requirements imposed on the manufacturer that they  
11 have to do. Some happen before production starts, some happen  
12 right after production starts. And we do these things to  
13 make sure for those emission threshold monitors that they  
14 turn on the mill on at the right point, we make sure the  
15 cars talk right to a scan tool. That's one of the things we  
16 got from feedback. A Smog Check started using OBD, we found  
17 some cars didn't talk right. We now have a conformance  
18 tool. We worked with SAE, the Society of Automotive  
19 Engineers, and developed a standardized tool that we can now  
20 make every car be tested off the assembly line and make sure  
21 it's gonna talk right. And we actually go through various  
22 things to make sure the monitors are running frequently in  
23 use. All these things that we've gotten from feedback in  
24 the field and learned where manufacturers made mistakes or  
25 things like that and cleaned it up. On top of that, of

1 course, my - one of the rolls of my section of my staff is  
2 to grab cars; we take new cars, we take old cars, we break  
3 cars, we make sure they're working like they're supposed to.  
4 There's a surprising amount of people watch me and my staff  
5 drive out of the lab in a brand new car that is running  
6 terrible because we've implanted a malfunction to go drive  
7 it on the road to make sure it's working right. We have  
8 programs where we get cars back from the field from Smog  
9 Check stations that are having problematic vehicles they  
10 can't figure what's going on or they think something's not  
11 working right. We'll bring those cars into our lab and  
12 spend some time testing them and looking at them. So we've  
13 got a pretty powerful feedback mechanism in today's world  
14 with the Internet and everything else. Pattern failures  
15 quickly show up. We get lots of feedback, we get feedback  
16 from the I/M data from Smog Check. Lots of things we can  
17 look at and look for trends to go investigate and see if  
18 things are showing up. Is OBD II perfect? No, of course  
19 not. You know, no program has ever been perfect. Two-speed  
20 idle, ASM, visual functional, everything you can always  
21 point out there's pluses and minuses to everything, things  
22 don't catch everything. We have found plenty of vehicles  
23 that don't right. We've gone after enforcement actions on  
24 many of these. In some cases, they're recalled, some cases  
25 it's a TSB, technical service bulletins, are issued with

1 special repair procedures. Oftentimes it's extended  
2 warranty settlements, you know, it depends on the nature of  
3 the case and what the problem is. A recent one that was  
4 announced and we had a press release on was regarding 1996  
5 through 1999, a substantial number of Dodge and Jeep  
6 vehicles had catalyst problems. And actually the catalyst  
7 was failing. And in some cases, the OBD system was picking  
8 it up and some cases it did not appear to be picking it up.  
9 But they were failing catalyst, actually rattling apart,  
10 destroying the sub-straights and showing up in I/M and other  
11 places with an empty - with no catalyst in the vehicle.  
12 This actually is something we discovered during testing in  
13 1999, I'm embarrassed to say it took us that long to work  
14 through that case, but there was some crafty work on the  
15 part of Chrysler's lawyers that slowed the process down, but  
16 we did get a settlement just recently in California. It's  
17 something like 90,000 vehicles with extended warranty and  
18 another 40,000 that are recalled, over \$1 million in  
19 penalties and other stuff like that. It also - there's a  
20 nationwide settlement with corresponding higher numbers for  
21 the rest of the nation. We do pursue these things, we do go  
22 after what we can find and fix. I hear a lot about false  
23 mills, and you know, manufacturers obviously are usually the  
24 first to find about false mills because it shows up in  
25 warranty. Technicians - cars are coming in, shows up as a

1 warranty claim, and no trouble found. Can't find anything  
2 wrong with the car, can't fix anything. There have been  
3 very, very few situations of patterned false mills. Car  
4 manufacturers actually tend to react very quickly when it  
5 does happen. Many times they show up in I/M and they will  
6 come back, so there are times when you have the first couple  
7 months of production of a year, and they'll find something  
8 and fix it within that fast and so it's - when you have a  
9 false mill where the mill comes and there's actually nothing  
10 broken on the car, nothing wrong, nothing that could be  
11 repaired, those situations have been very few and far  
12 between and the manufacturers have responded very quickly to  
13 fixing them. The vast majority of the systems out there do  
14 work correctly, so we test a lot of them, we have a lot of  
15 feedback parameters. Have we caught every single one that's  
16 not working right? No, of course not. Will there be cars -  
17 continue to be cars that don't work right? I'm sure there  
18 always will. We're never gone be in a situation where you  
19 can test every single car and make sure, but we have learned  
20 a lot and we have added a lot of requirements. You know,  
21 essentially, in 1996 was the first year of implementation  
22 and went across the nation and across all cars in 1996.  
23 There were a lot of added monitors in 1998 that phased in  
24 and in 2000 that phased in, 2002 that phased in, stuff that  
25 we learned - we hadn't earlier anticipated they would fail

1 or because emission problems like missing thermostats or  
2 stuck thermostats that we then quickly realized even before  
3 we saw them in the field, we figured out there was loopholes  
4 and then pushed to adopt requirements to close it up. And  
5 that is one of the things that has made this program. The  
6 manufacturers don't like it because they continually are hit  
7 with new challenges with new monitoring requirements, but we  
8 do go back to Board routinely and update the requirements  
9 when we find new technologies or things we might be missing.  
10 I want to go through a couple of Doug's slides that he  
11 presented to you and point out some perhaps alternate ways  
12 to look at it. You know, everybody likes to say there's  
13 many way to look at data. However, not always lead to real  
14 meaningful conclusions and I want to point out a couple that  
15 I think are probably not appropriate and then in some cases  
16 could be actually misleading to the Committee. And some of  
17 it I want to talk about is just what compare - which groups  
18 you're comparing and looking at. In some case I want to  
19 talk about how emission benefits and costs were calculated.  
20 And we'll get back into this about how - how dirty the car  
21 is before you fix it and whether that means it's a good  
22 thing or a bad thing. This is a slide that Doug presented  
23 that had a summary that he had built up to after three or  
24 four slides and he had sort of four categories of different  
25 sort of inspection scenarios and then he had worked out some

1 numbers for repair costs and cumulative reductions and a  
2 repair-effectiveness. The first thing I want to talk about  
3 is sort of the categories he broke down here. The first one  
4 makes sense. This was a mill OBD - this is a like an OBD-  
5 only I/M program. Most of the states in the nation for '96  
6 and newer are doing an OBD-only program, so this would be -  
7 the only OBD test and anything it catches you account for,  
8 anything it misses, you don't get. The next couple of  
9 categories he sort of split up. The first one, the mill,  
10 plus IM240, that would be caught by either program. It  
11 failed both tests, so if you had a mill-only - an OBD-only  
12 program, that would catch it. If you had a tailpipe-only  
13 program, that would catch it. And if you had an OBD and a  
14 tailpipe program, that would catch it. But then the next  
15 two, he's got called out by themselves, IM240, but no mill,  
16 and the last one he's got mill, but no IM240, and there's -  
17 I think it's a little misleading to go down these paths,  
18 because nobody's proposing a program that would only fail  
19 cars that have the mill on and fail the tailpipe or only  
20 have the mill on but don't fail the tailpipe. And - or -  
21 and so I think there's - I think more meaningful categories  
22 would be to look at what we commonly view a scenario as  
23 which would be like an OBD-only program. In this case, it  
24 was an IM240, a lab IM240 - a tailpipe-only program, or what  
25 maybe we have here today is an OBD and a tailpipe program.

1 So those are the sort of three realistic scenarios that most  
2 people are looking at and trying to make comparisons and so  
3 I've lumped his three together. The numbers don't change  
4 that much, but I think it's more meaningful comparisons than  
5 trying to figure out accommodations of programs that aren't  
6 really programs anybody is pursuing or looking at. One of  
7 the other - back to Doug's original chart, he had talked  
8 about cost per repair and he made some findings that - that  
9 some of the OBD repairs are the most expensive repairs and  
10 implied that OBD are more expensive - on average are more  
11 expensive repairs than those that fail IM240. And one of  
12 the important things to point here, of course, is averages  
13 for the costs of repair on IM240 are based on six and two  
14 vehicles and I don't think it takes the statistical power of  
15 Dr. Williams just to point out that an average repair costs  
16 based on eight repairs or six repairs to two repairs is  
17 probably gonna have a lot of variance in it and EPA, who  
18 actually did the data, the original testing program and Doug  
19 based his analysis on, when they released it, they put an  
20 average cost of repair, but they also put confidence  
21 intervals. All right, 95 percent confidence intervals that  
22 the true average falls within that range. And when you look  
23 at that, again we have the blue bar's the OBD one and with  
24 an average around \$450 and the red one is the IM240 with an  
25 average just above \$300, but the error bars on it show that

1       there's an overlap. The true average of the IM240 repairs  
2       might actually be up as high as \$410 and the true average of  
3       the OBD might be as low as \$320. There's overlap. And  
4       that's why EPA, when they wrote up their findings,  
5       determined there was no statistical difference between these  
6       costs of repairs. They just didn't have enough data. Now,  
7       subsequently, they have tested another 150 cars and if you  
8       look at OBD, it hasn't changed much. The average went from  
9       something like \$453 to \$459. The error bars got a little  
10      bit smaller, meaning you know, they're starting to maybe  
11      focus in on the true average. The ASM - the IM240 data  
12      actually changed quite a bit. We went from an average repair  
13      with eight repairs up to 17 repairs. It's now at \$454 and  
14      the error bars have gotten even bigger, because there's been  
15      even more variance there. So, I - I mean, from what EPA  
16      concluded from the same data that Doug presented, they said  
17      no statistical difference. Further testing seems to bear  
18      out why they presented the data that way. Updating his  
19      chart to include those costs per repair, you know, now you  
20      look at categories of \$459, plus or minus \$95, and \$450 plus  
21      or minus \$155. You start to see the average repair costs as  
22      EPA concluded are - seem to be in the same ballpark.  
23      Another that Doug presented on this chart here was what he  
24      called cumulative reductions in gram per mile, you know, as  
25      an emission reduction that he was getting from these cars

1 and summed it up from all the vehicles that those tests had  
2 failed. And he extrapolated, then he went from there to  
3 repair effectiveness and in dollars per gram. And the math  
4 is simple. He took the total repair cost for each of these  
5 categories and divided it by the cumulative reductions and  
6 got a dollar per gram, but it should have really been a  
7 dollar per gram per mile. And so the costs he have here, we  
8 talked about clean for day or I guess you could talk about  
9 clean for one mile because he's assuming that you got a  
10 repair benefit here for exactly one mile and that's all it  
11 lasted to get these dollar numbers. I'll plan out some more  
12 about why I think this methodology is wrong, but even if you  
13 took that and expanded that out to say, let's assume the  
14 repair lasts for two years and 25,000 miles or five years  
15 and 50,000 miles. The numbers obviously change dramatically  
16 and come down to numbers that are more in line with what we  
17 typically see for new measures. So, this calculation of the  
18 emission benefits I think is as important one and I've seen  
19 this a lot of times compared and I - this chart's gonna get  
20 a little busy, but I think we'll walk through it. I just  
21 wanted to show, you know, sort of a typical graph of a car.  
22 This is a normal, good car, as mileage goes on, some  
23 deterioration occurs in all the parts and emissions do tend  
24 to climb. From EPA's testing of 150 cars, over two-thirds  
25 of them, even though they were all over 100,000 miles, and

1 the emission standard typically only applies for the first  
2 50 or 100, 120,000 miles, all these cars were over 100,000  
3 miles. Almost all of them were out of the useful life where  
4 the standard actually applies, yet over two-thirds of them  
5 were actually still meeting the standards. So, good news  
6 is, we got a lot of cars, even high mileage, these newer  
7 cars are lasting longer, but they are staying clean. The  
8 majority of them are staying clean. And you know, again,  
9 you can draw this any way you want, but I just portrayed a  
10 normal good car deteriorating, staying within the standard  
11 for most of its life and even beyond that, and filled in the  
12 hypothetical OBD threshold up higher and at higher level  
13 that could be some alternate test or revised OBD criteria,  
14 whatever you want. If all cars stayed down on the good car  
15 deterioration, we wouldn't need Smog Check, we wouldn't be  
16 here. They'd all be perfectly fine, there wouldn't be  
17 anything we could do in a repair scenario. But we know a  
18 substantial number of them have something malfunction and  
19 they head off on another path. And this path you can show  
20 is steeper, shallower, everything else. I've got a couple  
21 examples here. I just wanted to give one of a moderate that  
22 starts to go on a decline. These are the excess emissions  
23 that we would like to avoid. If we could keep all cars down  
24 at the normal good car level, we could avoid all these  
25 excess emissions going (unclear). If we didn't touch this

1 car, it broke, continued down that path until the day it was  
2 retired, put it in a junkyard, whatever, those are excess  
3 emissions or emissions that are above what the car was  
4 designed to produced. And in a repair scenario, or an I/M  
5 scenario, when it crosses an OBD threshold, you trigger a  
6 light, you trigger an I/M repair, you bring the car back  
7 down as close as you can to the normal good car line, and  
8 you get what Doug had commented as accumulative reductions  
9 or a repair benefit. You went from a higher level down to a  
10 lower level and that's a good thing. But that's not really  
11 the emission benefit you get out of that car. The emission  
12 benefit is avoiding all this that had we not touched the  
13 car, this is the path that it would have continued to come  
14 along. It would have continued to head down this path. We  
15 would have lost all these. The little triangle on the left  
16 we've already lost. It's out in the atmosphere before we  
17 even identified the car as needing repair. But just looking  
18 at the before-repair to after-repair doesn't really tell us  
19 what we need to know for emission benefit. Infact, doesn't  
20 work that way, we don't model it that way and in a scenario  
21 where we have a higher level, a higher trigger point, you do  
22 get a bigger repair benefit. So by that strategy, the  
23 dirtier you let the car get before you repair it, the bigger  
24 the repair benefit. But if Sylvia came in here and said our  
25 proposal is we're gonna raise the ASM cut-points to get more

1 emission benefits because it's make the cars dirtier before  
2 they're repaired and that's gonna be a bigger delta, I think  
3 you guys would laugh her out the door. You know, waiting  
4 until it's dirtier before you fix it, doesn't get us more  
5 emission benefits. It does get a bigger repair benefit, it  
6 looks better that way, but we've lost a bigger a chunk and  
7 when you look at the emission benefit, we're getting a  
8 smaller piece of the pie that we could have gotten out of  
9 that vehicle. And as I said, you can run through this  
10 scenario with all types of different malfunctions, with one  
11 that's more severe and rapidly jumps up, you know, and  
12 obviously the more rapidly it deteriorates, the smaller the  
13 difference between the two emission benefits because it's  
14 gonna rapidly transition through whatever your cut-points  
15 are. And you can have all kinds of components, you know,  
16 you can have a gradual malfunction where again, you know,  
17 you have the OBD-triggered repair and emission benefit.  
18 With a higher level, it never would have reached that, you  
19 never triggered a repair. You do save the repair cost, but  
20 you also didn't get any of the possible emission benefit out  
21 of this vehicle. And that trick becomes is how do you  
22 figure out how many of malfunctions of which kind are out  
23 there and how many fall into this category and that category  
24 and you can have a catalyst malfunction that falls into any  
25 one of these categories. You can have a misfired, high

1 speed and in 10, 15 seconds, you can completely wipe out a  
2 catalyst. The next time you run an emission test, it'll be  
3 sky-high. You can have a gradual misfire, you can have just  
4 deterioration from the vehicle driving over miles and miles.  
5 The catalyst eventually wears out. You can have an engine  
6 burning a little bit of oil gradually poisoning the  
7 catalyst. So you can have even with one type of malfunction  
8 catalyst, you can have it fall into this category, all  
9 different categories. And that is one of the things that,  
10 you know, MFACT tries to do. It's why it's difficult to  
11 model because we - we test surveillance cars, we constantly  
12 try to update the model and we have vehicles in MFACT that  
13 some grow into moderate emitters, some grow into high  
14 emitters, some super-highs, you know, we have all that  
15 different types because we're trying to estimate what  
16 fractions fall into this, but of course, it makes the  
17 emission benefit calculation pretty difficult. And a lot of  
18 talk I hear about OBD is that, you know, this is where they  
19 think most of the OBD malfunctions fall. It's either right  
20 on the top of the good car, they can't see any emission  
21 deterioration at all, they run it and it looks the same or  
22 it's just this tiny amount and we'd be better off not  
23 spending the money to repair that if that's the only  
24 emission benefit we're gonna get out of the car. And  
25 there's a couple ways to look at that, but one thing is with

1 OBD and a lot of other systems, is once you have that first  
2 failure, you really don't know a lot of what's going on on  
3 the rest of the system. The system isn't designed to  
4 comprehend all types of multiple degradations and failures  
5 all happening at once. It's designed to catch things one at  
6 a time. And that's the only realistic way a car  
7 manufacturer can design it to make robust accurate  
8 decisions. And so if maybe the first failure is a coolant  
9 temperature sensor that by itself on the FTP doesn't have  
10 much emissions impact. The FTPs run at a moderate  
11 temperature range, 68 to 86 degrees, you can probably  
12 disconnect the coolant temperature sensor, the car will run  
13 fine on the FTP, it will start up fine, you probably won't  
14 see any emission difference at all, but you start that same  
15 car at say 50 degrees outside or 40 degrees outside or 110  
16 degrees outside and that coolant temperature could have a  
17 big difference. In a cold-start enrichment, you may even  
18 have start-ability problems, you may spitting and sputtering  
19 for a while and so just running the FTP might not show up a  
20 big increase, but other test cycles in the real world do.  
21 And once the coolant temperature sensor has failed and the  
22 system has detected it, it's gonna disable most of the other  
23 monitors because if it can't know what the temperature of  
24 the engine is, it's not gonna know if the catalyst should be  
25 warm and it's a good time to test it and see if it's working

1 or whether EGR should be up and running and they can test  
2 it. And so, once that first one happens, if we don't fix  
3 it, something else breaks, it could be heading down any one  
4 of these paths and we won't know about it. You know,  
5 whether it's a combination of multiple things that have  
6 added on and cumulatively they have a synergistic effect  
7 that suddenly drives it off. And so the impact of not  
8 fixing that one car, it really, the emission benefit could  
9 be any one of these path as a subsequent malfunction happens  
10 later in its life. And again, that adds to the complexity  
11 of trying to figure out how you calculate the emission  
12 benefit. This one's a little hard to read with the color  
13 here, but I talk about it's hard to figure out which ones  
14 fall into those different categories. The rapidly  
15 deteriorating ones, the gradual deteriorating ones. Here's  
16 a - I pulled a couple months of Smog Check data and - from  
17 2005 and look at 33,000 stored trouble codes for cars that  
18 were failing and did some summaries to figure out which are  
19 the most common problems. One of the beauties about OBD is  
20 you can actually get the exact trouble code that's stored in  
21 the car and tell you the nature of the problem as opposed to  
22 just saying there's high hydrocarbon that you might get with  
23 an ASM test or there's high NOX, which might be caused by  
24 multiple things, you can actually get a pinpoint of where  
25 the likely malfunction is and if you look, these are the top

1 10 DTCs. I've got the DTC - the actually diagnostic trouble  
2 code listed, what percentage of the total DTCs are  
3 represented and, for example, you look at the first one, PO-  
4 300, it's 15 percent of the stored DTCs were at PO-300, and  
5 it's from misfire. And it's one of those when you have an  
6 engine misfire, you have - you can have raw hydrocarbons  
7 going right out the back, you usually have an increase in HC  
8 and CO, but depending on what's going on with ignition or  
9 fueling problems, you can also have a NOX increase. And if  
10 you just look at - I summed up the top 10 here and these  
11 diagnostics represent, as an accumulative column there, 54.2  
12 percent of the total faults. So, of half the cars that are  
13 coming in the Smog Check and failing with this trouble code  
14 stored, they have one of these 10 fault codes. And if you  
15 look at these systems, we've got misfire, which is a major  
16 one that can do everything from causing you to have one a  
17 half times the emission to wiping out your catalyst in a  
18 matter of seconds. You've got catalyst faults, which I  
19 think everybody knows one of the most important control  
20 systems on your car and anytime catalyst decrease goes down,  
21 your tailpipe emissions go right up. Fuel system lean, you  
22 know, your - your fuel system is your primary emission  
23 control. Catalyst treats it up, fuel systems tries to keep  
24 the engine out of emissions low, the catalyst cleans up  
25 what's left. Evap leak, I think this Committee has

1 certainly talked about evap problems enough and pushing for  
2 the off-board pressure check to know the importance of evap  
3 emissions. Front O2, your primary system for fuel-system  
4 close loop, EGR, these are major hitters in your emission  
5 controls. If ask any technician to name off the five or six  
6 most important emission controls on today's cars, he's gonna  
7 name off catalyst and fuel system, EGR and O2 sensor without  
8 a doubt. He may or may not know too much about evap, but he  
9 should. But again, these are big hitters. These are not  
10 some little sensor on the car that has no impact. It's not  
11 some vehicle speed sensor that has no emission impact.  
12 These are, you know, half your trouble codes right here are  
13 big hitters. I wish I could give you an updated version of  
14 Doug's chart here that had numbers in the right columns  
15 filled in that gave you emission benefits and tons per day  
16 and cost-effectiveness and dollars per pound or dollars per  
17 ton and all that stuff. I don't. We are working on  
18 numbers. It is complicated. We have valuable data coming  
19 back from Smog Check now because we can break down the DTCs,  
20 we can look at faults, but even then, as I said, you can  
21 have catalysts faults that it might be rapid ones that went  
22 to 10 times the standard or gradual ones that went to two  
23 times the standard and - so there's a lot of - a lot of, you  
24 know, and we're working with out in fact modelers to try to  
25 quantify this. We're still bringing cars in. We will have

1 the numbers at some point and we are - I said I meeting with  
2 some of our staff internally tomorrow and - today and  
3 tomorrow to talk some more about this and get some numbers  
4 here, but the trend is still gonna be the same. Catching  
5 cars earlier, we're gonna bigger emission benefit out of it.  
6 Catching cars late - waiting until later, we're gonna get  
7 smaller benefit. The costs of repairs, the individual  
8 repairs are about the same. Yes, with an OBD-only program  
9 we'd have more repairs than we'd have with the tailpipe  
10 only. We'd have substantial reduction in emission  
11 reductions. Is that gonna make the cost-effectiveness  
12 better? You've got one side of the numerator and one side  
13 of the dominator, it depends on which is competing, but  
14 probably not. Doug had also presented this chart that I  
15 think was a little difficult to use, although, I/M people  
16 tend to love these charts and I see them at all the  
17 conferences I go to but he had tried to rank the cars from  
18 the highest emitters to the lowest emitters and kind of give  
19 you an increase here that showed what percentage, how many  
20 cars churned out - gave you what percentage of it. You  
21 know, we talk about - if you look at say 50 percent, he's  
22 here - you know, after three cars he got 50 percent of the  
23 benefit that he was gonna get out of all these cars,  
24 something like that. He spent some time talking on this  
25 slide about OBD had repairs that increased emissions after

1 they were repaired. So, I went in and I looked at the EPA  
2 data and talked to EPA about it. Three of these were cars  
3 that had the mill on for an evap problem, an evap system  
4 leak. That should not effect tailpipe emissions at all. If  
5 you fix an evap leak, those aren't emissions that come out  
6 the tailpipe, they come into the atmosphere through vent  
7 hoses. So then I started looking at actually the magnitude  
8 of these increases. They were all in the .1 to .01 gram per  
9 mile numbers, which is less than for these cars, 1 to 10  
10 percent of the standard they're certified to. In a typical  
11 Federal test or FTP test, if you can get back-to-back  
12 repeatability of less than 10 percent on the same test,  
13 you're doing pretty good. Most people tend to think 10, 15,  
14 20 percent is, you know, 10 or 15 percent is pretty normal.  
15 He's looking at repairs here that had, I mean, back-to-back  
16 emissions test that 1, 2, 5 percent difference that most  
17 people would chalk up to test-to-test variability from  
18 running the same test. He also talked about there's a lot -  
19 OBD identifies of, you know, marginal emitters or these cars  
20 that have small emission benefit. Again, there's evap  
21 failures in here that he didn't account for. We're not  
22 expecting evap to have a tailpipe increase or decrease after  
23 you make the repair. Not that we shouldn't make that  
24 repair, in fact, if you look at the impact of evap, you know  
25 it's even bigger. And I've got a slide about that. But it

1 didn't even account for that, and so here he's portraying  
2 some of these cars, at least six or seven of them, that had  
3 no benefit from making a repair if they all had evap and  
4 they had evap benefits. Not tail - they weren't expected to  
5 have tailpipe benefits. You know, evap obviously is an  
6 important one. This is showing the contribution to the  
7 South Coast Air Basin from emissions - hydrocarbon emissions  
8 from vehicles where they come from tailpipe or evap.  
9 Somewhere near the 2010 timeframe, our fleet is actually  
10 gonna have more emissions come from hydro - from evap  
11 systems than they are from tailpipe. Evap is gonna cross  
12 and be even more important than tailpipe there, so I -  
13 discounting and saying they have no emission benefit is -  
14 really isn't the right thing to say here. You know, they  
15 need to be accounted for some way if you're gonna calculate  
16 the emission benefit and as I showed earlier on the top 10  
17 DTCs, two of the top 10 were evap faults, so there's a  
18 substantial number of them that need to be accounted for as  
19 showing some emission benefit because they certainly do have  
20 an in-use benefit, but they're not gonna show up in a  
21 tailpipe number. One of the other things about these cars  
22 that seem to show no benefit on the FTP - OBD definitely is  
23 a different strategy and it really expands the coverage for  
24 catching excess emissions in use. You know, traditionally,  
25 in a Smog Check program, we've been limited to a two-speed

1        idle or an ASM test as an acceptable surrogate, acceptable  
2        in consumer cost and length of time it takes to do and it's  
3        intending to be a surrogate of the FTP or cover a range of  
4        the FTP and give us a good predictor of what it would do on  
5        the federal Test procedure. And really if, by design, tried  
6        to identify cars that are - because a large emission  
7        increase on the FTP. Phil had talked a little bit about it.  
8        You know, we used to target something that's two or three  
9        times the FTP standard would be caught by the ASM cut-  
10       points. FTP, of course, only covers a subset of in-use  
11       activity as well. As I talked before, it's a very  
12       constrained temperature range, from '68 to '86. It doesn't  
13       account for morning starts that are colder or hotter. The  
14       drive cycle has a limited acceleration. Most of your  
15       freeway onramps have much higher accelerations and loads.  
16       So the FTP only represents an area of the speed and loads  
17       that cars are operated in use. It doesn't really have any  
18       highway cruise operation. It doesn't have any freeway  
19       cruise operation, so you can false that impact freeway NOX  
20       emissions. A torque converter clutch stuck off. No impact  
21       on the FTP because you have very little steady state  
22       operation. But if you run a highway cycle, which is an  
23       emission cycle manufacturers have to run and calibrate and  
24       meet a NOX standard on, you'll see a 20 percent increase in  
25       NOX if you don't lock up the torque converter clutch during

1       that. So we have tried to patch that on the certification  
2       side on FTP by adding more things to the FTP. We added a  
3       highway cycle, we have a cold CO test, we have a  
4       supplemental FTP that covers high speeds and high loads, so  
5       we've been adding these conditions to make sure we cover all  
6       the in-use activity with certification tests, but the ASM  
7       and two-speed idle have all still been structured around the  
8       basic FTP and again are covering a subset of in-use  
9       activity. OBD threw that out the window and said if you've  
10      got a component that causes a measurable increase during any  
11      reasonable driving condition, you need to detect it. And so  
12      we definitely, we expanded the window. It's not just things  
13      that because you to exceed the FTP standards. If you've got  
14      a component that affects emissions in-use, you need to be  
15      able to detect a fault, store a code, and turn the light on  
16      when it's bad. So you are gonna get things like a torque  
17      converter clutch, like a coolant temperature sensor. They  
18      will have an impact in use. It might be on the highway  
19      cycle, it might during low-speed operation, it might be  
20      during cold temperatures. It will show up as a very small  
21      or not even a change at all on the FTP. And that's - that  
22      is - there's no way around that. I'm not gonna try to stand  
23      up and hide that or say that that's a bogus test or anything  
24      like that. It is in truth, because we went broader than we  
25      have with FTP when we did OBD. We covered the entire range.

1 Doug had also presented a slide here about the - from  
2 Colorado's data, what he had coined the lack of overlap  
3 problem and he drew these circles not drawn to scale and I  
4 found out later why, because it's very hard to find a  
5 computer software program that actually will draw these  
6 circles to scale unless you overlap them, because I tried,  
7 but you know, he portrayed a couple things and  
8 unfortunately, the text is kind of washed out here, but he  
9 had something like 8,000 vehicles in the mill on and 1,200  
10 in the exhaust failures and, you know, only 268 that failed  
11 both. So, you know, we are catching two complete sub -  
12 different populations here, what's going on? And this is a  
13 bad thing. OBDs turning the lights on for all kinds of cars  
14 that don't have high tailpipe emission and it's missing all  
15 those that do have high tailpipe emissions. There's a  
16 couple things about Colorado data that are important to  
17 know. A simple one, it uses the IM240 test. Phil eluded to  
18 it a little bit. It is a different animal than ASM. You  
19 know, there's gonna be differences. Colorado doesn't have  
20 an HC or NOX problem. They've typically had only a CO  
21 problem. They have set up their cut-points, CO is the only  
22 one they consider marginally stringent. They have - they  
23 use a CO cut-point that is double EPA's recommended cut-  
24 points for the IM240. So it's twice as high as EPA's  
25 recommended. For HC and NOX, they use cut-points that are

1 between three and seven times higher. We couldn't get away  
2 with that here in California. We need - in fact, we  
3 probably get away with that on CO, but we need the HC and  
4 the NOX benefits. If you took the Colorado program and put  
5 in EPA's final cut-points, those numbers are gonna change  
6 dramatically because a lot more of those cars that are the  
7 mill-on - a lot more cars are gonna fail tailpipe no matter  
8 what. I said they have pretty lax cut-points. Maybe that  
9 was okay for them, they'd only had a CO issue, that was all  
10 they were attacking. But it's not very representative of  
11 what we're doing here in California and I don't think it  
12 gives you a very good insight into what is going here, what  
13 can be done here. I pointed to it earlier, Doug uses - he  
14 includes evap failures in there with no, you know, they show  
15 they have no tailpipe increase. He's called - a lot of  
16 times he calls these false fails. The mill's on, there's  
17 not a tailpipe increase. Again, we don't expect evap  
18 failures to have a tailpipe increase. So, I just want to  
19 point out that that data's not very representative of what  
20 California does. In fact, Colorado's even changed, it's not  
21 very representative of what they do either. But I tried to  
22 do the circles and I couldn't get a program that would  
23 actually draw them to scale, so I came up with a bar graph.  
24 I just took data from here in California, this is from the  
25 second quarter of 2005 and the Executive Summary and I tried

1 to put down, the yellow was the ones that failed the ASM  
2 tailpipe. Green is they failed tailpipe and OBD, so that's  
3 the overlap of the circles and then the blue are the ones  
4 that only failed OBD. As a disclaimer, I did include all  
5 the functional checks in with OBD. If you look at these  
6 newer cars, OBD failures dominate the functional failures,  
7 even though there's some with gas-cap failures and stuff  
8 like that that might get lumped in there, OBD is the vast,  
9 vast majority of them. And if you look at, say the 1996  
10 model year, where as Doug was showing in Colorado, they had  
11 something like 8 or 9 to 1 OBD failures to I/M tailpipe  
12 failures. Adding the yellow and green together you can see  
13 we have about six to seven percent ASM failures, adding the  
14 blue and green together we have something like 12 or 13  
15 percent OBD failures. So we've got in the neighborhood of  
16 two to one OBD failures to ASM. You know, it's nothing like  
17 nine to one or eight to one that he's presented with their  
18 loose cut-points. And one of the other things you might  
19 notice here as we get to lower cars, obviously we have fewer  
20 and fewer data on the newer cars with the exemptions the way  
21 they are now. One of the other things you'll notice is  
22 newer cars have a catalyst that's more powerful. It's less  
23 deteriorated, it can cover up a lot of things. So you can  
24 have up-screen problems that the catalyst can really soak up  
25 a lot of that. Move to an older car, when the catalyst has

1 more miles on it, it can tolerate less of that. You know,  
2 the same EGR fault on a car five year later can have a much  
3 bigger tailpipe impact. This overlap or lack of overlap  
4 issue that Doug presented, it's been studied quite a while.  
5 I participated in a FACA, Federal Advisory Workgroup, we've  
6 talked about this. It's been through everything. EPA spent  
7 a lot of time looking at this. Certainly, neither test is  
8 perfect. OBD or tailpipe, just like we've had discussions  
9 about two-speed idle and ASM and whether we should be adding  
10 and doing two-speed idle and ASM. Certainly we know there's  
11 cars that two-speed idle will pick up that ASM passes and  
12 vice versa and trying to weigh the differences between the  
13 added test time and cost and if you could figure out exactly  
14 which cars would fail (unclear) only have them do, you know,  
15 you'd have the best of both worlds. Some differences are  
16 expected. You're never gonna see tailpipe increases or  
17 decreases from evap emissions. And one of the things that I  
18 want to talk about and Phil had eluded to a little bit and  
19 might explain some of why his data shows what it does it,  
20 ASM is not gonna be able to the catch lower emission  
21 vehicles that we have today anywhere near the stringency  
22 that we've identified cars before. I think this will help  
23 explain - even though he cut it off - his analysis off at  
24 '95 and older, you'll find even in that time some new  
25 standards were coming in. ASM we use typically the same

standards in that age group. But you might find cars like a Honda that can be at 10 times standard it will certify to, which is still cleaner or about the same as a car certified - a '93 car certified to a dirtier standard. And I have a slide on that but we are gonna be approaching the limits of capability on ASM pretty soon to catch cars that are reasonable, multiple or standard. I said with the lack of overload EPA spent a lot of time about it. EPA did conclude that an OBD II-only program got them just as much benefit as any tailpipe only program and that was excluding evap. They didn't even add in evap and they said tailpipe versus OBD will get the same benefit or more. You throw evap on, it's just icing on the cake, which it might be big icing on the cake, because it's a big benefit. And one thing that people maybe not realize is in the past, we've had ASM cut-points that we've ratcheted down over time and eventually approached final cut-points or gotten more benefit out of and Phil had presented earlier on, you know, maybe there's some room to ratchet some more down. We're not actually using OBD to the fullest potential right now. OBD, while you can't really change cut-points, one of the things we do with OBD is there are flags in there called readiness monitors that are used to identify if somebody has disconnected the battery recently or cleared fault codes and the intent that these flags were created was to know if

1 somebody was trying to cheat the system by stopping around  
2 the corner to disconnect their battery to clear out the  
3 memory. These flags change are not ready indicating, hey,  
4 the system hasn't had a chance to check itself out. We are  
5 in a situation right now where we, as a compromise, we  
6 developed this nationally for people who legitimately have  
7 their car repaired the day before or the day of or two days  
8 before their repair and only drive it five or 10 miles back  
9 to the repair station, trying to distinguish those people  
10 who haven't given their car enough time to run all the  
11 monitors and check itself out and say I'm okay, from  
12 somebody who literally is disconnecting their battery around  
13 the corner. And so right now, we have - there's multiple  
14 readiness monitors on a car, somewhere between three and  
15 seven, and we allow up to two of them to be incomplete. So  
16 there is a loophole, if you want to call it that where  
17 people can actually disconnect the battery and clear codes,  
18 get back through the inspection before all their monitors  
19 have checked off and said, okay, I'm perfectly okay. So  
20 that's one of the things that EPA and we have been  
21 continuing to look at is ways to maximize the use of OBD.  
22 Trying to balance consumer inconvenience by telling them  
23 you've got to drive around for a week before you come back  
24 for Smog Check, versus catching the people that are actually  
25 not fixing the problem. And we did some study, we did some

1 study with UC Riverside, the C-cert and they did some  
2 analysis for us on looking at OBD records and figuring out  
3 how to tighten that criteria up and what the benefit would  
4 be. We focused on cars that were failing the ASM test, but  
5 were passing the current OBD inspection, which again allows  
6 up to two of these monitors to be incomplete. And so the  
7 bars on the left are - we looked at separately for ASM fails  
8 and ASM gross polluters and with the system we have today,  
9 we're flagging about 20 percent. The red bar on the far  
10 left here is flagging about 20 percent of the cars that say  
11 are ASM fails, 20, 25 percent of them, OBD is also failing.  
12 Of the gross polluters, we're about 50 percent of them. So  
13 50 percent of the cars that fail gross polluter, OBD is also  
14 failing. If we tighten up that criteria to say all the  
15 monitors had to be complete. Instead of two incomplete, you  
16 could have zero incomplete, those numbers will jump up to  
17 say 50 percent for fails and 75, so clearly if you give the  
18 system time to actually run all its monitors, you can close  
19 the loophole on some of these people. We looked at another  
20 version which also looked stored trouble codes as another  
21 criteria. That might be possible. It inked it up a little  
22 bit more. And in that same study, we started to look at,  
23 okay, so we can't - maybe we won't get all the cars that ASM  
24 says is failing, what - or how much of the emission benefit  
25 of the cars that's failing. So we've actually brought these

1 cars in and studied them. Even with the current program  
2 where we have this loophole, even though we're flagging only  
3 about 25 percent or 50 percent of the eight gross polluters  
4 that say they're fails, we're flagging the dirtiest ones.  
5 We're getting 75 to 80 percent of the benefit. About 60  
6 percent are NOX, about 75 percent of HCs. So even though  
7 we're flagging a quarter to a half of the cars, we're  
8 getting the biggest emitters, so we're getting most the bang  
9 out of the - so in the overlap, we're getting most of the  
10 highest emitters. If we tighten up our criteria and said,  
11 you know, in zero readiness, all the monitors had to be  
12 complete, we can jump into the 85, approaching 90 percent  
13 and move NOX to up above 70. In this revision three, I'll  
14 talk about some more and some further studies, but we  
15 actually started looking at a plan we're we could use OBD as  
16 a clean screen or a fast-pass mechanism where we sort of  
17 have a hybrid program and I have a couple slides on that  
18 where we would sort of combination and try to get the best  
19 of both worlds and figure out which ones we should direct to  
20 ASM and OBD as opposed to just OBD. Doug, I said this is  
21 Doug's slide, he presented this ranking of cars that were,  
22 you know, OBD failures and showing that there's a couple big  
23 hitters that account for most of the emissions and a lot of  
24 ones down here and he'd also had, you know, they were  
25 outweighed by two vehicles that OBD had missed and one of

1 his conclusions was OBD misses the dirtiest of the cars.  
2 When you look what his graph - his picture here that had all  
3 of the vehicles on it, the two that OBD missed are here. I  
4 don't know if I would consider necessarily this one as one  
5 of the dirtiest cars, it's down here pretty low on the  
6 tailpipe numbers. He did have one way up here, you know,  
7 nine - on his scale here of (unclear) plus a 10<sup>th</sup> of CO plus  
8 a NOX. Wouldn't you be surprised to know that's a Dodge  
9 truck with an empty catalyst that has been recalled? So  
10 there is reason for that car and the catalyst being '96,  
11 '98, '99 percent efficient in converting what's coming out  
12 of the engine, one truck with a missing catalyst is worth,  
13 you know, 50 to 60 other cars. So, his analysis that it  
14 missed most of the dirty cars is dominated by one truck  
15 that's missed that was identified as OBD non-compliant back  
16 in '99, finally had an enforcement case settled earlier,  
17 just late last year. So, again, I - you know, whenever  
18 you're using such a small dataset as what he'd look at here  
19 with two cars and six cars, you can kind of get a skewed  
20 view of what's going on. One of the programs that we've  
21 been doing at ARB in conjunction with BAR is looking at all  
22 these cars that ASM says are dirty and OBD continues to  
23 pass. We can theorize about what's going on, we know some  
24 of them are probably using that readiness loophole and  
25 getting through. We know there's some not perfect OBD

1 systems, but we spent a lot of time analyzing this data. We  
2 started with gross polluters, and said hey, we're only  
3 flagging 50 percent of the cars that ASM says are gross  
4 polluters. What's going on, is OBD missing them all, are  
5 they not dirty, are they really dirty. So we brought in 37  
6 of these vehicles. We solicited them from Smog Check  
7 stations. If they had a car that was eligible, they called  
8 us, we talked the owner into loaning us their car, we gave  
9 them a rental car, couple hundred bucks, for the station for  
10 recruiting them for us we gave them a free tank of gas, that  
11 kind of stuff. A costly, costly proposition to bring these  
12 cars in and we would baseline test them. We'd run ASMs and  
13 FTPs and all that kind of stuff and then we'd send them out  
14 for undercover repairs to Gold Shield stations, so the  
15 stations didn't know they were an ARB car, they weren't be  
16 supervised. You know, we'd get repair estimates or have  
17 them make repairs and bring them back in. So these are cars  
18 that failed ASM as gross polluters, but passed the OBD  
19 inspection. If you look at the analysis, it's not that  
20 different from Doug's as far there's a couple cars here that  
21 we're already at 50 percent of the emission benefit after  
22 six or seven cars. So you've still got cars that are a  
23 couple high emitters, you know, or a portion of the fleet  
24 making up the vast majority of the emission benefit. We had  
25 zero benefit, like Doug had said we had zero benefit from a

1 bunch of OBD cars or very little. We had zero benefit from  
2 14 of the 37 cars. Again, these are all cars that failed  
3 the ASM as gross polluters out in the field. So these are  
4 cars that we brought them in our lab, they were never dirty  
5 again. We sent them out for undercover repair. They either  
6 didn't make repairs or they made repairs and got a passing  
7 certificate and we tried to treat this just like a consumer  
8 would do. We'd walk into a station and say my car failed,  
9 you know, I don't know what's wrong with it, can you figure  
10 out what's wrong with it, call me. You know, I need to get  
11 a Smog Test, we used Gold Shield so a lot of them could test  
12 them - fix them, test them, and there were just some non-  
13 repeatable fails there that we'd try everything to make them  
14 dirty. We looked for preconditioning problems, we tested  
15 them cold, we tested hot, we tested them pushing sideways on  
16 the car to try load up the dyno, we tried standing on the  
17 scale to give them heavier test weights, we tried lots of  
18 things and really struggled to - on these vehicles to have  
19 anything go wrong. We also had a guy clean pipe one for us.  
20 We didn't ask him to, little does he know he clean-piped a  
21 car for the Air Resources Board and BAR and probably not the  
22 smartest thing to do. But in looking at these gross  
23 polluters, you know, we said, well what's going on with  
24 these cars. 45 percent of the benefit, all the benefit we  
25 can get out of catching all these cars, 45 percent of it

1 happens to 96 or 99 Dodge, Jeep trucks. Catalyst problems  
2 on those vehicles. This was a big issue. It was a big  
3 case. That is obviously more than their market share.  
4 Dodge and Jeeps do not account for 40 percent of the cars on  
5 the road, or even 30 percent of the cars or anything like  
6 that, so they are a disproportionate number of this benefit.  
7 One note on here, we have an after-market catalyst that are  
8 sold here in California that don't meet the same standards  
9 as OEM and that's been allowed for a long time. We have a  
10 breakpoint with OBD II cars in 1996 where we had set a  
11 higher level for the aftermarket catalyst. They didn't have  
12 to be as good as the OEM, but they have to be a lot better  
13 than they used to be. And not that many have been certified  
14 yet, less than dozen have been certified and they are not as  
15 universal as the old cats so there's for a lot of these  
16 cars, there's not an aftermarket catalyst available right  
17 now. We still found a substantial number of these  
18 aftermarket catalysts being illegally installed, the \$99-  
19 type stuff. A lot of the cars we took in there, that's the  
20 first repair, again, these are the cars that have no OBD  
21 fail information. So these are cars that you take into the  
22 technician and all he knows is that it's failed Smog Check  
23 and OBD says I don't see anything wrong. And when you do  
24 that to a technician on today's complex car, almost nine  
25 times out of 10, he's gonna come back with it needs a

1 catalyst. Whether that's the right repair or not, that's  
2 what he's gonna come back with. I don't necessarily blame  
3 him. It can be costly and expensive to go to the trouble of  
4 diagnosing these cars and you may hit a point where you're  
5 spending four hours to diagnose it when you could have put a  
6 catalyst and two other parts on it for that same amount  
7 time. These guys are not in a good situation. But if you  
8 give them a car that's failing with no OBD information about  
9 anything failing, they are gonna struggle. You know, it's  
10 one of the problems we tried to address with OBD is giving  
11 the guy repair information. And we certainly found some of  
12 these cars that came in with one or two monitors incomplete.  
13 By the time we run it through our program, the next  
14 monitor's run, the lights on for the catalyst, the lights on  
15 for this or that and we'd often would clear those cars, get  
16 them back into the situation they were at when they failed  
17 the Smog Check and take them into repair stations so he's  
18 faced with the same thing we are. Some of the techs were  
19 smart enough to go, you know what, catalyst monitor hasn't  
20 run. Maybe I need to try to exercise that or - you know,  
21 EGR hasn't - you know. And so we've definitely had some  
22 successful repairs, but by and large, these were difficult  
23 repairs for these guys to make. Repair costs accordingly  
24 were high. Our average, instead of the numbers we were  
25 seeing before were \$526. You know, calculating the way EPA

1 did, the true average is somewhere between \$395 and \$657.  
2 Just about half of them were repaired under the \$450 cost  
3 limit. So we had at least two of them where the guy came  
4 back to us and said you know what, I haven't been able to  
5 fix it. You've spent \$600, you can go to the referee and  
6 get a waiver now. We had guys who got so frustrated in not  
7 being able to fix the car that they did extra repairs that  
8 they didn't charge us for. We had guys add extra catalysts  
9 onto the car trying to get it to pass before they gave it  
10 back to us. But they didn't charge us for it and didn't  
11 tell us about it. Only when we started looking at the car,  
12 we went, wait a minute, that catalyst didn't use to be  
13 there. So there were some diligent mechanics trying to find  
14 a way to get it to pass.

15 CHAIR WEISSER: I want those names after the meeting.

16 MR. MCCARTHY: But, you know, and part of the cost is driven up.  
17 Some of these cars, I mean, 16 of them, so almost half of  
18 them, ended up having an OEM cat replaced. And OEM cat,  
19 since there's not a lot of aftermarket cats available for  
20 them, the OEM or the original equipment cat, they tend to be  
21 expensive. \$700 is not uncommon, \$700 or \$800. If there  
22 were aftermarket cats available for all these cars, they're  
23 running around \$300, \$275, \$300 for the OBD II level  
24 aftermarket cats that would bring the cost down. It would  
25 bring the average repair cost down almost 20 percent. So,

1 you know, as we are pushing the aftermarket cat manufactures  
2 to develop more compliant cats, we are - we will see those  
3 cost numbers drop down. But these are troublesome cars to  
4 fix. And they're not all dirty. This shouldn't be a  
5 surprise to you again, the data from the second quarter of  
6 2005 that just shows by model year, the failure rates, you  
7 know. You see some of the same trends where the failure  
8 rate goes up and then it starts to fall back down perhaps  
9 like you saw with the 1987 Golf, although we would say you  
10 were still on the climbing rate for '87 in here, but - and  
11 here's the start of OBD II and you could see we went from an  
12 OBD-I system and a tailpipe and visual functional to  
13 suddenly checking a lot more things. We do have a bump in  
14 the road there as far as there is a lot more things subject  
15 to the I/M test there. But the other thing is, the vast  
16 majority of our failures are coming from '95 and older  
17 vehicles. There's, you know, '75 percent of the fails. And  
18 if you look at the emission benefit, I'm sure it's even more  
19 than that because these are the older cars that were  
20 certified to higher standards, so there's higher grams per  
21 miles. My point is we need ASM and we need ASM for a long  
22 time, because it is - the primary benefit we're getting out  
23 of ASM is on these '95 and older cars. It's gonna be that  
24 way for a long time. This would tell us we're way out here.  
25 You know, we need dynos and we need ASM tests because that's

1 the best test we know of for these vehicles. But, when you  
2 start going forward, ASM is gonna have some issues with the  
3 cleaner, the lower and lower emission cars. I apologize for  
4 the color of the font here, but these bars are the  
5 hydrocarbon and NOX certification standards, the federal  
6 test procedure, FTP standards, and the far left one is Tier-  
7 0, it goes to Tier-1, and then some of our categories, TLEV,  
8 LEV\_I, ULEV, SULEV, which are ultra-low emission vehicles  
9 and stuff like that. These are - Tier-0 and Tier-1 are most  
10 '92 through '95, '96 cars are all Tier-0 and Tier-1. And  
11 '96, '97, we started to get some TLEVs and then LEVs, by  
12 '99, there's a lot of LEV\_Is. By 2002, there's a lot of  
13 ULEV\_IIs. By 2010, we'll probably have 30 percent SULEV.  
14 So we - and in one model year, manufacturers can certify  
15 mixes of these things to meet an average, so they might have  
16 a Corvette certified at a TLEV and a Chevy Cavalier  
17 certified at a ULEV in combination of that stuff. In ASM,  
18 for '92 and newer, we use one set of cut-points. We do not  
19 differentiate between any of these emission levels. So even  
20 so, these cars are certified to emission standards and  
21 designed to emission standards that are 1/20<sup>th</sup>, 1/40<sup>th</sup> of  
22 what the '92s and '95s were, we're using the same ASM cut-  
23 points. I mean, it's not hard to figure out. It's relative  
24 cut-points. If we were targeting to try not to false-fail  
25 any cars for Tier-0s and Tier-1s and don't call anything bad

1 that's less than say two times the FTP standard or something  
2 like that, instead of two times the standard for Tier-0,  
3 Tier-1, that's gonna be 20, 30 or 40 times the standard for  
4 a ULEV or SULEV or something like that. One solution would  
5 be to tighten up the cut-points for these newer cars.  
6 That's one thing Phil was looking at is maybe identifying  
7 some of these cars and they can go to lower cut-points. One  
8 the - again on the bar here on the far left is a typical ASM  
9 cut-point for these '92 and newer cars with an HC level  
10 around 40, 50, 60 ppm, a NOX cut-point 400 to 600 to 700  
11 ppm. We tested our lab LEV, a LEV\_I, a ULEV\_I, and a SULEV.  
12 We got emissions all under 10 and 15 ppm for all pollutants.  
13 I - you know, Mr. Nickey can certainly weigh in on this but  
14 if he were to have to fix cars to a cut-point of 8 ppm or 6  
15 ppm hydrocarbon and -

16 MEMBER NICKEY: Zero.

17 MR. MCCARTHY: You know, there's not even tests - your '87 VW  
18 Golf went from 53 to 101 ppm HC 65 miles later. Now that's  
19 bigger variance than I normally see, but we are not going to  
20 be able to hold these things anywhere standard. You know,  
21 when we FTP test these cars, and I'm getting - sometimes the  
22 mouse clicks and sometimes not. If we use the SULEV as the  
23 baseline and look at the FTP level, when we get to a - I'm  
24 gonna try up here. Am I just not getting the wireless?

25 MEMBER NICKEY: Maybe your battery's dead.

1 MR. MCCARTHY: Can you give me two more clicks? Yeah. The  
2 ULEV\_I one car is roughly on FTP about four times the  
3 emission level of a SULEV and a LEV\_I is seven times the  
4 emission level of a SULEV. Yet ASM reads no meaningful  
5 difference between those. So, I mean, we're talking about  
6 cut-points that would - that are just down in the noise  
7 level on the ASM analyzer and it does probably - when we  
8 spend in our lab to test SULEVs, we have, you know, \$2  
9 million dynos and we have \$5 million in instrument trains  
10 and analyst equipment to measure those things reliably. You  
11 know, we're not gonna get anywhere near the same precision  
12 in the lab or field-grade type of equipment. So, again, I  
13 just point to that we need to be aware of this and - all  
14 right, you're gonna have to let her go. Here's a slide that  
15 Sylvia presented to you guys before back in January of 2004.  
16 It kind of summed up some of the inspection costs and stuff  
17 like that and I just wanted to point out that inspection  
18 costs in this calculation, inspection costs account for 70  
19 percent of the total cost of the program. You know, repair  
20 costs account for around 30 percent. So Doug had focused  
21 some of his analysis on, you know, ways to reduce repair  
22 costs. Yes, it is going to reduce emission benefit, yes it  
23 is gonna reduce - you're gonna take some repairs off there,  
24 but even if you cut repairs in half, you're gonna cut  
25 emissions substantially and you're not gonna reduce that

1 much of the overall cost of the program. If you can attack  
2 inspection costs, you could make a substantial difference.  
3 Ideally, we can attack inspection costs and not reduce  
4 program effectiveness. And that leads into one of the  
5 continued studies we started with looking at gross  
6 polluters, we're continuing to look now at just normal fails  
7 and see if we're seeing anything different in the analysis.  
8 So we're recruiting cars that fail at Smog Check stations  
9 and right now we're in a situation where we're getting the  
10 best of all worlds. We're throwing every test we can at the  
11 book, except for two-speed idle, we're throwing OBD at it,  
12 we're throwing ASM, maybe we're not using OBD as tightly as  
13 we could, but we are throwing every test and every test we  
14 throw at it, the more chance you got to catch them for a  
15 fail somehow. One of the approaches that we're looking at  
16 that seems to show some promise is using OBD as sort of a  
17 fast-pass or clean screen. So if we can tighten up the OBD  
18 criteria as far as require all the monitors to be complete  
19 or basically have OBD say not that everything looks okay,  
20 that everything looks great, then we say okay, give it OBD  
21 only and move on. If it says OBD looks okay, like we have  
22 with today's program, then let's throw it through the whole  
23 - throw everything we got at it. Throw it through the whole  
24 program we have today. That type of program, you know, we  
25 can target, we can get probably two-thirds or more, probably

1 70 percent of the cars getting an OBD-only inspection.  
2 (recording distortion) The consumer's gonna - there's gonna  
3 be pressure. Somebody else is gonna figure out if two-  
4 thirds of the cars are being tested in five minutes, he's  
5 gonna lower his prices. Two-speed idle is shorter than ASM,  
6 it had a shorter test. I think we'd see prices come down.  
7 Then somebody would figure out a pricing structure that  
8 would work and you'd probably see all kinds of them. In  
9 that program, if we could put two-thirds or more of them  
10 through an OBD only, then divert the rest to a tailpipe plus  
11 OBD, you know, that's - identifying the cars that would most  
12 likely be dirty giving them more tests. In fact, if we  
13 could add even more tests, we might it's cost-effective  
14 because we're taking a smaller amount of the cars and  
15 putting them through more tests, we might find things like  
16 it's even more cost-effective to add two-speed idle just to  
17 that because you're adding just to a small set of them. So  
18 you might be able to get, you know, the more thoroughly we  
19 can test the cars we think are dirty and the less time we  
20 spend on the cars that look clean, we're looking at emission  
21 data analysis, it looks very promising. We look like we can  
22 capture 85, 95 percent of the benefit we're getting from  
23 subjecting all cars to both tests by subjecting like just a  
24 third of them to both tests or less, and two-thirds of them  
25 just the one test. You know, we're still working the

1 emission numbers, I don't have tons per day and what it  
2 would lose. It should be smaller than what it was with the  
3 four and five and six year exemption. You know, we know we  
4 don't want - it's a show-stopper pretty much. You know, we  
5 have some preliminary numbers, but so that's one of the  
6 things I'm meeting with people here internally to try to get  
7 you a credible number for that because we wanna come into -  
8 that's the missing piece of the puzzle we have right now is  
9 what is it gonna translate to in a tons-per-day loss. We  
10 really don't want any back-step at all right now. You know,  
11 and it becomes a delicate balance between cost-effectiveness  
12 and emission benefit. But, we think there's a promise there  
13 and like I said, we're continuing to study that and hoping  
14 that's gonna prove out. That brings me to the end. I'm  
15 sorry it has taken so long here, but I mean, OBD, we believe  
16 OBD is working as intended. We spend a lot of time in the  
17 field making sure it's doing it and updating the  
18 requirements. It is very different from tailpipe. I stress  
19 that, I don't mean to sound like I'm preaching to you or  
20 anything like that, but it is different. It does take a  
21 different attack at finding broken cars and a comment  
22 earlier, you had asked somebody - Phil, if tightening the  
23 cut-points was gonna get some marginal failures and whether  
24 those were gonna be hard to repair and that's been the  
25 criticism of OBD is it's gonna fail lots of marginal

1 failures that aren't that high on FTP and I talked a little  
2 bit about why FTP isn't the end-all to tell you everything.  
3 But, with OBD, you're not gonna - it's not gonna be hard to  
4 repair. OBD does store a code, turn the light on, narrow it  
5 down to a likely area. So, again, when you measure FTP, you  
6 might call it a marginal emitter, but it doesn't mean it's  
7 one of those that's harder to repair because you're  
8 scratching your head, going well, there's five things,  
9 partially deteriorated, which one do I go after. OBD will  
10 call one of them out as bad because it's shorted - open  
11 circuit problem like that. And -

12 CHAIR WEISSER: Mike -

13 MR. MCCARTHY: Yes?

14 CHAIR WEISSER: - you've been a remarkable young man in the last  
15 65 minutes to present us with this much information without  
16 taking a break for a drink of water or anything. I feel  
17 like you have another couple of hours of stuff that you'd  
18 like to chat with us about.

19 MR. MCCARTHY: No, I don't.

20 CHAIR WEISSER: And on -

21 MR. MCCARTHY: I did want to present to you that, you know, a  
22 kind of a thorough picture and let you know I am available.  
23 I work for CARB, been working for a long time. I said  
24 anything with OBD comes through my shop, I mentioned a  
25 report from Mr. Escalambre. I know Rick, he's attended

1 training classes I taught. He's asked me to review the  
2 manual that you were talking about for training procedures.  
3 It's a small OBD world and I -

4 CHAIR WEISSER: Well, there are lots of questions I'm sure  
5 people on the Committee will have for you and the public.  
6 And we'll get into them. I suspect we'll be seeing more of  
7 you in the future. Let's start down at the left. Roger,  
8 nothing. Paul?

9 MEMBER NICKEY: Wait, wait, wait.

10 CHAIR WEISSER: Oh, Roger. Okay.

11 MEMBER NICKEY: You didn't give me time to grab.

12 CHAIR WEISSER: Well.

13 MEMBER NICKEY: I just had one brief one. I keep seeing the  
14 repeat of evap information and how important it is. Do you  
15 have any idea, of all the evap failures that keep popping  
16 up, how many of them are loose gas caps?

17 MR. MCCARTHY: You know, that certainly the car manufacturers  
18 spend a lot of time working on this too because those are  
19 the ones they hate for warranty repairs. When it comes -

20 MEMBER NICKEY: I know but -

21 MR. MCCARTHY: - back for consumer action. So we do have - most  
22 manufacturers have set up a separate diagnostic strategy to  
23 try to identify gas caps and in most, say 2001 to 2002 and  
24 newer cars, a lot of cars have a separate indicator where  
25 they will flash a warning light to the driver -

1 MEMBER NICKEY: Yes.

2 MR. MCCARTHY: - check gas cap. And it's not for any emission  
3 leak they detect. They actually have separate strategies  
4 where they can pinpoint it down to they think the likely  
5 area is the gas cap and they can do that with complex things  
6 like, if it is a loose gas cap, when you draw vapor through  
7 it, you're gonna pull up more - more HCs right off the top  
8 of the gas tank as opposed to if it was a leak in a vent  
9 hose. Then there's some complex strategies about what they  
10 do and the size of the orifice. So, manufacturers are  
11 trying to test that way to minimize the number that come in.

12 CHAIR WEISSER: They've also changed the gas cap itself so that  
13 it's a -

14 MR. MCCARTHY: Lot of manufacturers spend time with it.

15 MEMBER NICKEY: Yeah, not for the better either.

16 MR. MCCARTHY: Yeah, a lot of them went that way and bailed back  
17 out of it because they just didn't like it. But  
18 manufacturers spend a lot of time trying to figure that out.  
19 We've looked at it, too. I have never seen any concrete  
20 data or any credible data.

21 MEMBER NICKEY: Well, I would just hate to think that we decided  
22 that it was so important that we're going to do evap testing  
23 when it really turned out that a lot of it was loose gas  
24 caps.

25 CHAIR WEISSER: Yeah.

1 MR. MCCARTHY: Certainly from past - when we pursued and evap  
2 requirement, we had done it because we had done off-board  
3 testing for long years on all our surveillance cars. That's  
4 one of the things we do is - when we do that we pressurize  
5 through the gas cap. So, we would not be catching any cars  
6 with leaking gas caps.

7 MEMBER NICKEY: I'm talking about statistically.

8 MR. MCCARTHY: I - I know, we did that. But when we did that  
9 and found the failure rates that were out there, they were  
10 substantial and they were excluding all gas caps.

11 MEMBER NICKEY: Okay.

12 MR. MCCARTHY: So that's the thing that I could have that sort  
13 of portrays - that points in the direction. You know,  
14 there's other evap failures, purged faults and stuff like  
15 that, that obviously aren't' loose gas caps. But I - for  
16 the evap leaks, I can't really give you a good idea.

17 CHAIR WEISSER: Anything further, Roger?

18 MEMBER NICKEY: That's it.

19 CHAIR WEISSER: Paul? John, you okay? Yeah? Dennis?

20 MEMBER DECOTA: Michael, basically the issue of one of the  
21 industry issues has been getting current and easy-to-obtain  
22 repair information with regards to OBD II systems for the  
23 aftermarket as a whole, not - why hasn't, I mean, you -  
24 you're a master of what you - you seem to be a master of OBD  
25 II. Why haven't you proposed regulations, because the Smog

1 Check law does mandate as far emission-related repairs that  
2 it be made available to the industry, a library where the  
3 automotive aftermarket can come to a web-based program and  
4 readily have available to them this repair information and  
5 possible failures that may be at that certain diode or that  
6 certain sensor, that type of thing, to check. Why haven't  
7 we, I mean, why haven't we gone that step?

8 MR. MCCARTHY: You know, I've - my former boss at ARB and one of  
9 his staff now are the ones that push through the service  
10 information world from the ARB from the Burton bill that was  
11 passed and they codified it into regulation. I have been  
12 involved in that a lot. In the past, we never, we never  
13 prescribed what a car manufacturer had to have in a service  
14 manual. You know, and a lot of service information rules in  
15 the past targeted - we're still not gonna tell you what you  
16 have to have in your service manual, but whatever you do  
17 have in it you have to make it available to anybody who's  
18 working on your cars. So, you know, the catch phrase on  
19 that one is if you make crappy information available to your  
20 dealers, you can make crappy information to the aftermarket.  
21 But this doesn't mean you did either. With this Burton bill  
22 and the information rule, it was the first time we actually,  
23 with that bill, it proscribed and said that you have to have  
24 a description of how your OBD monitors work, you have to  
25 have descriptions of the typical enable criteria to run that

1 monitor, typical malfunction criteria, if you have atypical  
2 models, you need to specify those. And it was the first  
3 time it went in and actually said, I don't care if you  
4 weren't on planning on providing this to the dealers, or you  
5 don't want to tell them, you're gonna need to make it  
6 available. And so, I think we did take a very proactive  
7 step in - albeit, late, because we did it two or three years  
8 ago, not in 1995, but it was the first time we actually put  
9 in there you have to have this minimum amount of information  
10 to help a technician figure out how the system works. You  
11 still see differences. You know, I use the websites  
12 constantly, because when we're working on cars and that's  
13 one of the QC procedures we use to check and I tell you,  
14 there are some manufacturers that go out of their way to  
15 give good service information and it's neat and it's clean  
16 and the dealers can find everything wrong and the  
17 aftermarket can find everything, and there are manufacturers  
18 that I don't know how their dealers fix their cars.

19 MEMBER DECOTA: I understand.

20 MR. MCCARTHY: And so, I guess it's been a fine line with  
21 providing stuff free, you know, mandating they make stuff  
22 available for free versus mandating they make stuff  
23 available that's good. And one thing I have noticed is  
24 consolidators like All Data and Mitchell (phonetic) and out  
25 of the OEM service information websites available, those

1 manufacturers - those have gotten a lot more competitive,  
2 they have a lot more detailed information and I think they  
3 are becoming a more comprehensive, rather than a  
4 consolidated skimpy - in skimpy cases, they have gotten a  
5 lot better, and I mean I see those as an essential part of a  
6 technician's tool box as having access to service  
7 information.

8 MEMBER DECOTA: Right. But you have much more information with  
9 regards to performance of that system than the average shop  
10 does. You also have the ability of oversight. Why not take  
11 and go forward in the next budget meeting and recommend that  
12 you put together some type of library - online library so  
13 this industry would pay you and pay the State of California  
14 for that type of information versus being forced into a  
15 zillion different areas trying to find information. I mean,  
16 you have the ability to be the traffic cop here. You know,  
17 I mean -

18 MR. MCCARTHY: Yeah, but -

19 MEMBER DECOTA: I don't know how it happens, but that's one  
20 thing.

21 MR. MCCARTHY: Okay.

22 MEMBER DECOTA: The other thing is, I know that in many years on  
23 this Committee that even before OBD II and now we're getting  
24 into OBD II repairs.

25 MR. MCCARTHY: Right.

1 MEMBER DECOTA: Okay. The industry - they're out of warranty.

2 MR. MCCARTHY: right.

3 MEMBER DECOTA: They're starting to come out in the field and  
4 we're performing these OBD II repairs. We know that, you  
5 know, basically under these repair scenarios that there is a  
6 great deal of interpretation problem for the technician, you  
7 know, that needs to be clarified some way. Especially when  
8 it comes to interacting with the parts issues, i.e., cats,  
9 and everything else.

10 MR. MCCARTHY: Okay.

11 MEMBER DECOTA: And I think that's a scenario that needs to be  
12 regulated. I think that's a scenario that needs to be  
13 overseeing even more so and I know you have regulations now  
14 on cats, but there should be issues that, you know, if you  
15 use illegal parts, you should lose your right to perform  
16 these tests. There should be some meat put in there. Okay.  
17 The last thing is that emissions on non-OBD cars, we know, I  
18 think and forgive me, Steve, maybe you weren't but I'm  
19 thinking back many years ago. You did a report for IMRC,  
20 that basically, I believe, and I don't know if it was you,  
21 Steve, that showed that a car seven years or older - I'm  
22 talking about non-OBD II cars referenced in Jeffrey's  
23 presentation, the emissions performance fell off the table.  
24 Okay. Deteriorated. The golden year was seven years and  
25 older and I mean they just took. That information should be

1 made available to Jeffrey on his issues. I think it would  
2 be helpful. But this industry, I think, wants to perform.  
3 Okay. But there are monetary reasons that create hurdles  
4 that it can't perform in the repair scenarios as it should.  
5 I think Government needs to step in and help regulate.  
6 Okay. And I think we could do a lot better in reducing  
7 emissions if we could get timely and easily-accessible  
8 repair information on these vehicles. And I would hope that  
9 your Department is working in that area.

10 MR. MCCARTHY: Certainly, you know, one of the things that you  
11 talked about, the aftermarket cats, that actually is one  
12 that's in my section's responsibility. I'm the one that's  
13 supposed to back to the Board in a couple months.

14 MEMBER DECOTA: (inaudible)

15 MR. MCCARTHY: We have a higher standard for a catalyst. It's  
16 in interim agreement actually right now. We're getting the  
17 catalyst manufacturer certified, too. We want to codify it  
18 into regulation. In aftermarket, other replacement parts,  
19 we haven't gone down that path, you know, to look at. It's  
20 sort of a self-process for a manufacturer if he determines  
21 his own part is a replacement part and functions  
22 identically. We can challenge him on it, but he doesn't  
23 come through us to certify. So, auction-sensor  
24 manufacturers don't come through us to certify and that's  
25 one that we did some recent studies that maybe elude to the

1 fact that we need to step in and do some stuff there to try  
2 to get a higher level of standard. I guess, service  
3 information we talked about a little bit. Certainly, I  
4 think we're looking out for you. Some people think the  
5 check engine light comes on for just about anything these  
6 days. We're trying to send more repairs your way.

7 MEMBER DECOTA: (overlap) the consumer.

8 MR. MCCARTHY: Yeah.

9 MEMBER DECOTA: It makes for a bad repair.

10 MR. MCCARTHY: I agree and that -

11 MEMBER DECOTA: Because you can't information.

12 MR. MCCARTHY: And I agree and I do take that to heart because  
13 we did in this undercover program, although we were focusing  
14 on cars that passed OBD, when you take cars in and there is  
15 still a basic level of information that's not there in  
16 technician training and I think it's gonna be an age-old  
17 problem. It's always gonna be there, but there's gotta be a  
18 better way to it. I said Rick Escalambre has contacted me  
19 to try to help in reviewing some of the training material  
20 for BAR licensing and stuff like that. So, I've tried to be  
21 involved in those things to some extent to help out.

22 CHAIR WEISSER: Mr. Pearman?

23 MEMBER PEARMAN: First, I'd like to try and understand a table  
24 you had, tightening up also gets most of the ASM emissions  
25 benefits.

1 CHAIR WEISSER: Which page are you on?

2 MEMBER PEARMAN: Page 12 in our book. And I think it was  
3 related to the overlap discussion you had.

4 MR. MCCARTHY: Correct.

5 MEMBER PEARMAN: And so the way I understand it is that you're  
6 saying at least, I guess, for the '96 and older cars, if you  
7 just had - we'll call them in because of OBD failure, you  
8 get X amount of emission reductions. If you looked at cars  
9 that were calling because they failed the test and those  
10 repairs and emission reductions, you get a different number,  
11 and the first number, the OBD number is 70 percent of the  
12 second number from the testing. At least for the '96 and  
13 older cars.

14 MR. MCCARTHY: Well, that's the - that's the overlap area.

15 OBD's gonna call out a number of cars over here, most of  
16 which ASM did not also fail, so there's a population of OBD  
17 fails that are gonna get emission benefit that ASM did not  
18 flag and that chart was specifically looking at the second  
19 set of population, which is cars that fail ASM. How many of  
20 those also got detected by OBD. And so I was focusing -  
21 that's not the whole benefit of the program, because there's  
22 still another set of population of cars that fail OBD and  
23 passed the ASM test that are getting us benefit right now  
24 that I didn't - I was just focusing on for these few that  
25 are the ones that are failing tailpipe that ODB doesn't

1 fail. You know, I'm trying to look at that subset of cars  
2 and figure out what's going on there. I'm not sure I'm  
3 answering your question yet.

4 MEMBER PEARMAN: Well, but again, 70 percent is overlap, but  
5 then there'd be some benefits because OBD would catch  
6 something from the - that ASM test would not have caught.

7 MR. MCCARTHY: Correct. Correct. So -

8 MEMBER PEARMAN: So, you know, maybe that brings the number down  
9 to -

10 MR. MCCARTHY: Right. That could be even equal or even bigger  
11 magnitude or a smaller magnitude, you know, so in the total  
12 program, OBD might be getting us 90 percent of the benefit  
13 and the extra ASMs getting us 20 percent or -

14 MEMBER PEARMAN: So in other words, and again, OBD can't do much  
15 for the pre-'96 cars then.

16 MR. MCCARTHY: Right. OBD II didn't go into effect until 1996.  
17 There was an OBD-I system from about '93 through '95, but  
18 it's very, very, very limited in it's capability and  
19 usefulness, which is what prompted us to go to OBD II  
20 immediately.

21 MEMBER PEARMAN: So, I mean, putting aside the effect on repair  
22 stations and industry, which you can't do, but let's assume  
23 arguendo, what you're saying is this monstrosity of a  
24 testing program we have is designed to catch 10 percent of  
25

1       the post-'96 emissions losses and all the pre-'95. That's  
2       the purpose of it basically.

3 CHAIR WEISSER: Can you say that again, Robert, I'm not sure I  
4       followed that.

5 MEMBER PEARMAN: Well, if they had this overlap of the OBD,  
6       you'd be getting 70 percent of the post-'96 emissions  
7       reduction anyway, without any testing. Correct?

8 MR. MCCARTHY: If we went to OBD only, an OBD-only inspection.

9 MEMBER PEARMAN: Exactly.

10 MR. MCCARTHY: You still gotta bring them in and force people to  
11       respond to the light.

12 MEMBER PEARMAN: Right. Sure, that 70 percent failing.

13 MR. MCCARTHY: But you're right. If, you know, you could get,  
14       with OBD only you could probably get most of the benefit  
15       that we're getting right now. You certainly could get just  
16       as much as if you'd just done tailpipe. But tailpipe plus  
17       OBD gets a little bit more and yes, it's not that much more.  
18       Just like if we probably add TSI - two-speed idle to ASM,  
19       we're gonna get a little bit more, but it's probably not  
20       gonna be 50 percent more or something like that. You know,  
21       you get a little incremental benefit and we're trying to  
22       calculate that benefit right now, but yes, this data would  
23       suggest that if we could tighten up the OBD inspection  
24       criteria and get - or use one of these hybrid clean screen,  
25       fast-pass type algorithms to use OBD only for part of it, we

1 think we could get the - we'd get it all for - but we'd  
2 still - even in that hybrid scenario, we'd still be  
3 subjecting some of them to tailpipe plus OBD.

4 MEMBER PEARMAN: Well, that was my other question because you  
5 were suggesting is since that maybe in some ways in such a  
6 scenario, the savings for maybe not having the needless  
7 test, if you would, could be used for more focused testing  
8 on certain types of vehicles. Another alternative though,  
9 would be to take some of that money that was saved from the  
10 nonessential ASM testing and buy a lot of those older cars  
11 and just get them out of the system.

12 MR. MCCARTHY: Right. I mean, that's, you know, sort of the  
13 path the Carl Moyer funds and all kinds of stuff where we  
14 try to get more effective -

15 CHAIR WEISSER: Yeah, it's also a question of in whose pocket is  
16 the money.

17 MR. MCCARTHY: Right. If anything we probably need to lower the  
18 scrapage fee for 1987 VW Golfs because they seem to be going  
19 away pretty fast on the road.

20 CHAIR WEISSER: Okay.

21 MEMBER PEARMAN: The other question I had was you were kind of,  
22 I guess, redoing one of Doug's charts and summary data  
23 updated emission benefits and you had some costs per repair.  
24 And my question went to whether your estimates reflect the  
25 real world, because you said that the OBD would, you know,

1 fail on one item, but there might be other items wrong with  
2 the system in the car that either would have happened over  
3 time or that will now be caught when the car's brought in.  
4 So, in your repair costs are you just saying if there was a  
5 front O2 circuit failure, are you just looking statically at  
6 what it costs to fix that, or are you looking at the real  
7 world that a repairman would see, not only that failure, but  
8 others and would force those repairs and is that what you  
9 reflect in your chart?

10 MR. MCCARTHY: That chart was based on the EPA's data, their  
11 high-mileage data. So they were running the program and as  
12 Doug had noted, the technicians that were doing the repairs  
13 were under the - not to say the supervision, but they knew  
14 they were being monitored for repairs. So there is some  
15 concern about what that translates to. In their program  
16 scenario, the sort of domino effect where if there's one  
17 fault and they fix that and something else happened, in  
18 their test sequence, they probably would have shown up in  
19 their test sequence and they would have kicked it back into  
20 the repair loop before it got out.

21 CHAIR WEISSER: But yes or no. That number that's reported is  
22 the initial repair, it's not the - it's the whole -

23 MR. MCCARTHY: It was the whole repair.

24 CHAIR WEISSER: Okay.

1 MR. MCCARTHY: There was only - I believe in the first 153,  
2 there was two cars they got a comeback on -

3 CHAIR WEISSER: Okay.

4 MR. MCCARTHY: - that would have had perhaps another repair show  
5 up later that wasn't included. They did have some that  
6 dominoed where they fixed one thing and then two more things  
7 showed up. So those repair costs should include all that.  
8 It wasn't just the initial repair. But there were two I  
9 think that came back after -

10 CHAIR WEISSER: It is real world, except you have a bunch of  
11 techs that knew that every step was being monitored.

12 MR. MCCARTHY: Right. And you know, in the program that we did  
13 here at ARB, they didn't know they were being monitored.  
14 You know, we sent them undercover and we tried to use Gold  
15 Shield stations because we'd say, hey, keep fixing it until  
16 it passes. You know, because these were gross polluters,  
17 you had to be a test-only or Gold shield to be able to re-  
18 certify and so we tried to use those guys almost all the  
19 time so we could just say hey, did it pass, well no, all  
20 right, well fix it, what else do you have to do and try to  
21 keep them in that loop so we could get the total repair cost  
22 just like a consumer would do.

23 CHAIR WEISSER: Okay, we need to - Bruce, do you have anything?  
24 Just a couple of things and we - we're running a little  
25 late.

1 MR. MCCARTHY: Sorry.

2 CHAIR WEISSER: You know, I think the key message that I got and  
3 your presentation is really marvelous, I wanna thank you for  
4 your energy, knowledge, and the fact that you're working for  
5 the State. You really emphasize the different purposes of  
6 the program and the - the sort of advance benefit that you  
7 can get out of OBD that's not present with more traditional  
8 testing. And if you're wondering whether we got the  
9 message, at least one person got that message.

10 MR. MCCARTHY: Okay.

11 CHAIR WEISSER: I'm really interested in understanding, however,  
12 what the implications are of the extension of the exemption  
13 from four to six years over the utility of the OBD program.  
14 You know, there's nothing that would make me fix the car  
15 after the warranty on the emission control equipment is  
16 over, which is - what is it now in California?

17 MR. MCCARTHY: \$350 for anything that turns a light on, but most  
18 cars have bumper-to-bumper of \$336 so most people associate  
19 it with a \$336.

20 CHAIR WEISSER: Yeah, \$336, but that's very optimistic since the  
21 average user is going 16, 17,000 miles, so really you have  
22 about an 18-month to 2-year warranty.

23 MR. MCCARTHY: Right.  
24  
25

1 CHAIR WEISSER: And then given a choice for the next four years,  
2 I guess I'll by a little piece of black tape and just cover  
3 the mill light.

4 MR. MCCARTHY: Certainly it's a possibility. I mean we - we  
5 have data from before we went to that to try to see how many  
6 were showing up or ignoring it until they had to show up at  
7 I/M.

8 CHAIR WEISSER: And what's the data show?

9 MR. MCCARTHY: It is a pretty small number. We had failure  
10 rates of two and three percent, I believe. I'd have to  
11 double-check to make sure, but I believe that was the number  
12 that we were seeing. On four or five or six-year old - four  
13 or five-year old cars.

14 CHAIR WEISSER: So you were having two to three percent failures  
15 on five and six year old cars that are not being fixed.

16 MR. MCCARTHY: Off the top of my head. I mean, it was awhile  
17 ago that I looked at that data. But I believe it was in the  
18 ballpark, but you know, so we were spending money to test  
19 '98 clean cars -

20 CHAIR WEISSER: I think that's a tremendous issue. You know, we  
21 have a -

22 MR. MCCARTHY: Yeah, absolutely. And I mean I agree with you.  
23 I think most people the warranty - you know, after three  
24 years or 36,000 miles, which they'll get to before three  
25

1 years, probably stop - although there's probably some  
2 trends, probably not a step change.

3 CHAIR WEISSER: Obviously.

4 MR. MCCARTHY: You know, there's some - because usually a two-  
5 year-old car still has quite a bit of value. Somebody's got  
6 a lot of money into it.

7 MALE: Even a (unclear) right?

8 MR. MCCARTHY: Right. So there's a timeframe in there -

9 CHAIR WEISSER: Well, I think that to some extent there's a  
10 little disconnect between the extension of the exemption and  
11 increased reliance on OBD, particularly for the first few  
12 years.

13 MR. MCCARTHY: And you know, the only other, one of the other  
14 datasets we have, there's been some states that have run  
15 advisory OBD programs and so they're not failing on OBD.  
16 And we had some data to see maybe what a better real-world  
17 rate is. There's roadside data, EPA's high mileage data,  
18 they grabbed only cars with over 100 thousand miles and  
19 granted they were probably cars that had higher mileage  
20 group rates, because they got them - you know, they're gonna  
21 '96 and '97 higher mileage groups to get the 100 thousand.  
22 They did recruit a lot from repair shops, so while the car  
23 wasn't necessarily in for a repair, it might have been for  
24 an oil change or it probably had some reason that it was  
25 visiting a repair shop on their fleet, you know, they had a

1 mill rate of 30 percent, 25 or 30 percent. So, 60 - you  
2 know, two-thirds, three quarters of them were passing with  
3 no fault detected, a quarter to a third of them had a mill  
4 on at over 100 thousand miles. You know, that's just one  
5 more piece of the data in trying to project out where the  
6 mills start coming on.

7 CHAIR WEISSER: Well, I look at your California Smog Check fail  
8 rates -

9 MR. MCCARTHY: Yep.

10 CHAIR WEISSER: - and you know, you have the rates which become  
11 miniscule as you learn newer model years. But I'm kind of  
12 curious how you get that data if these cars aren't being  
13 called in for Smog Check. Is this just a projected data out  
14 of the -

15 MR. MCCARTHY: No, well, this was second quarter 2005 data, so  
16 we were still grabbing -

17 CHAIR WEISSER: Oh, okay.

18 MR. MCCARTHY: We were still grabbing cars at that point. We  
19 still had a big chunk of cars that were through the program  
20 that hadn't - the exemption hadn't kicked in on yet. And of  
21 course, there's still some out-of-state stuff trickling in,  
22 but the numbers get real small on those bars. You start  
23 looking at bars of 60 and 40 and 60 and 80 cars instead of  
24 thousands and tens of thousands.

1 CHAIR WEISSER: Is there a relationship between the OBD system  
2 and the referral of cars to test-only versus test-and-  
3 repair, versus consumer choice between test-and-repair and  
4 test-only? Is there - is there -

5 MR. MCCARTHY: You mean like an OBD fail rates at different  
6 types of stations or I'm not sure what you're asking yet.

7 CHAIR WEISSER: Well, you know, you were - maybe this is  
8 something that we should explore in the future but you were  
9 talking about, you know, how you could see the program  
10 evolving with greater reliance on OBD. I'll just for today  
11 pass it up because we're running out of time.

12 MR. MCCARTHY: Okay.

13 CHAIR WEISSER: Let's open it up to questions or comments from  
14 the audience. We'll start in the back with Mr. Ward.

15 MR. WARD: Thank you, Mr. Chair, Members. Randy Ward  
16 representing the California Emissions Testing Industries  
17 Association. I know that I certainly appreciated Mr.  
18 McCarthy's presentation and I expect the rest of the  
19 audience did. Thank you very much. One of the things that  
20 he mentioned was the potential for the cost being driven  
21 down for testing because OBD II test obviously is a much  
22 easier test and I think this is more for the BAR - or the  
23 ARB's edification than it is for yours, but about 70 percent  
24 of the cost of a smog test at a test-only, and I would let,  
25 you know, Bud and John and Dennis and others comment on

1 test-and-repair, but is attributable to fixed cost as  
2 opposed to labor. So I think to assume that you're somehow  
3 gonna have a Java City Quick Stop go in and get plugged in  
4 is unrealistic. Another issue that I want emphasized, and  
5 I've raised the issue before, and I thought Dennis did it  
6 very well today, was the issue of the confusion among  
7 manuals, the lack of detail that's provided in manuals.  
8 Roger has wrestled with this and communicated ineffectively  
9 for a number of years with the Bureau and the Bureau has  
10 wrestled with it. There are numerous engine types, numerous  
11 types of vehicles out there, much more than there were, you  
12 know, so many years ago and when you need tech support and  
13 you've got a consumer there, you don't get it. The best you  
14 can do in some cases is write a letter to the Bureau saying  
15 the information that I had was inadequate, therefore, you do  
16 a CYA letter to the Bureau and you indicate what you did and  
17 how you performed that test, but you will never be able to  
18 get an answer immediately on the phone. In many cases,  
19 you're risking, literally risking your license, is that  
20 correct, Roger, by conducting a test inconsistent or where  
21 you don't have good information and Roger can - can add to  
22 this, but, so you send them down the street where someone  
23 who is less concerned or the dealer where the consumer is  
24 going to pay not only a lot more money, but in either case

1       have been seriously inconvenienced. In any event, Dennis, I  
2       think you raise a very good point. Thank you.

3 CHAIR WEISSER: Roger, do you have something you want to add?

4 MEMBER NICKEY: Yes, I did, because I've dealt with this many,  
5       many times. And usually the answer I get from the Bureau is  
6       if you don't have adequate information, don't test the car.  
7       So we end up going to the customer and saying I'm sorry, I  
8       can't test your car. Then they ask you why you can't test  
9       it and you say because it's untestable and I have no  
10      procedure to do it with it. He goes down the road, like  
11      Randy says, gets it tested some place else less concerned  
12      and we get the looks okay to me scenario and we look like  
13      idiots.

14 CHAIR WEISSER: Yeah.

15 MEMBER NICKEY: And I've had a couple of them come back and go -  
16      nay-nay-nay at me because they said well, they tested down  
17      the street and you wouldn't do it. Or they end up going to  
18      the dealership and paying twice as much.

19 CHAIR WEISSER: I think the issue, maybe I misheard Randy, but  
20      the issue associated with the capital investment for both  
21      test-and-repair and test-only and the implications of  
22      movement to more reliance on OBD, more reliance on remote  
23      sensing is a substantial issue that the State of California  
24      has to come to grips with in terms of evaluating future  
25      program directions. We gotta get it on the table, we gotta

1 look at it squarely. Because the fact is that - well, I'll  
2 just stop there. It's something we're gonna be wrestling  
3 with in upcoming years, I guarantee it. Okay. Other public  
4 comments? Len? Happy 2006 to you.

5 MR. TRIMLETT: Len Trimlett, Smog RFG. As these cars get more  
6 advanced electronically and, in terms of emission control  
7 systems, one of the things that I keep hearing now is  
8 diagnostics. The emission systems being more complex, it  
9 appears possibility that there's insufficient training for  
10 the technician in terms of diagnostics and going through  
11 these systems. Is that possible?

12 CHAIR WEISSER: Well, I think we've all heard issues associated  
13 with the training required to deal with OBD II and the  
14 information available to do that training.

15 MR. TRIMLETT: I think that - I think that's one place that's a  
16 big area of concern.

17 CHAIR WEISSER: Okay. Thank you, Len. Mr. Peters?

18 MR. PETERS: Mr. Chairman, Committee. Charlie Peters, Clean Air  
19 Performance Professionals, representing a coalition of  
20 motorists. I'd like to start to say that I found the  
21 previous presentation provocative, interesting, and a whole  
22 lot of other superlatives, and that this is probably one of  
23 the very few folks that, in fact, is on virtually a daily  
24 basis dealing with real cars, dealing with people at the  
25 manufacturer's level, people at the aftermarket level,

1       etcetera, and actually making a very significant  
2       contribution to this process for California. And I salute  
3       this gentleman absolutely for what he does and the  
4       contribution that he has made. Having said that, I also  
5       would like to say that he's in a position - he's on a hot-  
6       seat. He's in a position that can put the wrath of God  
7       right straight on his backside. Probably on his front side,  
8       too, in that if issues such as (unclear) that have a 90  
9       percent cleaner standard than the regular cars that we're  
10      looking at today that have a 15-year, 150 thousand mile  
11      warranty and if in fact you are testing those cars and in  
12      fact you find them at fault and if in fact the manufacturer  
13      can be required to recall everyone of them and fix them,  
14      that that could put some serious heat on his front side and  
15      backside. When you have issues that - his contribution is  
16      huge, but having said that, the fact that there are  
17      stakeholders, there are people who can orchestrate fire on  
18      him and maybe work their way in a way, I would ask you to,  
19      in addition to looking at all the marvelous things that he  
20      does and his contributions, the Committee take on a  
21      responsibility of taking that and looking even further and  
22      take a responsible position to support him and support the  
23      possibility of situations like OBD II can be manipulated  
24      with a computer program out of a laptop and make it where it  
25      passes every test, every time and support him in a way

1       that's going to truly contribute to - further to the State  
2       of California, because I think this gentleman does a  
3       marvelous job and with your help, he can do an even better  
4       job that will better compliment a future for California.  
5       Thank you.

6 CHAIR WEISSER:   And thank you, Mr. Peters, and on behalf of  
7       Mike, I think I will thank you.  Mike passed me a note while  
8       you were talking saying that's why he makes the big bucks.  
9       Thank you very much for your kind words.  Are there any  
10      other comments from the public?  Mike, on behalf of the  
11      Committee, I want to thank you.  You packed more information  
12      and energy in the time you had than I for one had the  
13      ability to absorb.  So, I think you are going to be  
14      hearing from us again because I'd like to learn more about  
15      the program and you have quite a bit of knowledge to share  
16      with us.  So thank you.  Folks, we are lagging well behind  
17      our schedule.  I guess it's now time for lunch.  We're gonna  
18      do legislative update right now and I know we're going to be  
19      losing some Committee Members and - pardon me?  We have  
20      Emily on tap, but we will end this at 4:00 and I'm real  
21      worried that I don't wanna cut you short.  So let's see  
22      where we are, how much time we have left and how flexible  
23      you are in terms of the time you need and we'll go from  
24      there.  Rocky, could you give us the legislative report now?

25                   - o0o -

1 MR. CARLISLE: You bet. Starting off with AB184, Cogdale  
2 (phonetic), it was a pilot program to replace gross  
3 polluting vehicles with cleaner burning vehicles that were  
4 donated to a program. Essentially, I spoke with the  
5 Assemblyman staff yesterday; that bill is dead. They're  
6 gonna reintroduce a bill that's gonna decrease the scope,  
7 both in geography and time and it's gonna be in the San  
8 Joaquin Valley. So that'll be introduced shortly.

9 CHAIR WEISSER: Excuse me, that's going to be introduced this  
10 year, in this session, the second year of this session?

11 MR. CARLISLE: Yes, correct.

12 CHAIR WEISSER: Okay. Thank you.

13 MR. CARLISLE: AB226, still in Senate appropriations. I didn't  
14 get a call back on that. On AB386, we had a meeting at the  
15 Capitol the first part of this month with the consumer  
16 groups and that was a very productive meeting. That one is  
17 still moving forward. They're trying to resolve the issues  
18 that the consumer groups have primarily with regard to the  
19 open-endedness, if you will, of the - that it provides the  
20 Administration in adopting this agreement between ARB and  
21 BAR. AB578, that's the Horton bill that would allow Gold  
22 Shield to test directed vehicles. That's still moving  
23 forward. They are meeting with the interested parties on  
24 that and I did not get a call back from the Assemblywoman's  
25 office. On AB898, that's a bill that wants to reduce the

1       number of hours for training for technicians. They want to  
2       take it down to 60 hours from the current 180 hours. I  
3       haven't heard anything on that either, so it's hard to say  
4       where that one is right now. Like I say, I didn't get a  
5       call back from the Assemblywoman's office.

6 CHAIR WEISSER: Let me just ask a question on that one. That's  
7       still in the Assembly, is that correct?

8 MR. CARLISLE: Correct.

9 CHAIR WEISSER: So that has to move out by the end of this  
10       month?

11 MR. CARLISLE: It's gotta be out by the end of this month, yeah,  
12       or it dies.

13 CHAIR WEISSER: So, it's -

14 MR. CARLISLE: So -

15 CHAIR WEISSER: It's at an uphill battle.

16 MR. CARLISLE: And finally, AB1870 is a bill that was recently  
17       introduced by Assemblywoman Lieber. That's a smoke bill  
18       that would require a smoke test component on the Smog Check  
19       inspection process by July 1<sup>st</sup> of 2007. They originally  
20       were going to increase the cost limit in that bill. That  
21       did not get introduced as part of this bill, so I don't -

22 CHAIR WEISSER: By increasing the cost, you mean adjust the \$450  
23       limit according to some -

24 MR. CARLISLE: Correct, to about \$700, where it should be.

1 CHAIR WEISSER: So, is it possible for you to chat with the  
2 staff?

3 MR. CARLISLE: I will chat with the staff on that issue -

4 CHAIR WEISSER: Okay.

5 MR. CARLISLE: - and see what happened, because the last time I  
6 talked to the staff, that was going to be a component of the  
7 bill.

8 CHAIR WEISSER: Yeah. Do we have a position from either ARB or  
9 BAR on the smoke test, on the Lieber bill yet? Are you  
10 going to have a position? We don't know. Up to the Gov.  
11 Okay. Thank you.

12 MR. CARLISLE: And finally, Senate bill 953 by Romero. That one  
13 is the follow-up actually to Robert Morgester's presentation  
14 that he did November of '04 for the Committee and that's  
15 gonna owners of improperly registered vehicles to file for  
16 amnesty and avoid prosecution, but they will have to pay any  
17 past due penalties as a result of undervaluing the taxes due  
18 on their vehicles and they will have to be brought into Smog  
19 Check compliance. And once again, these vehicles have to go  
20 to the Referee, I might add, so it's another issue with the  
21 RFP out there.

22 CHAIR WEISSER: Yeah. Okay, I'm going to suggest in the future,  
23 Rocky, that we combine the Executive Officer's Activity  
24 Report and the Legislative Update into one item.

25 MR. CARLISLE: We'll do that.

1 CHAIR WEISSER: Okay. Are there any comments from - or  
2 questions on the part of Committee Members regarding this?

3 Are there any public comments on any of this? Len?

4 MR. TRIMLETT: Len Trimlett, Smog RFG. Exactly where does that  
5 SB953 bill stand now? I've seen no updates in the  
6 legislative bill -

7 MR. CARLISLE: Nor have I. Last I checked it was still in  
8 Senate transportation and the -

9 CHAIR WEISSER: This is 953?

10 MR. CARLISLE: Yes, 953.

11 CHAIR WEISSER: Yeah.

12 MR. TRIMLETT: Right. There is no legislative update on that  
13 bill in terms of actual wording and that's what I was  
14 looking for.

15 CHAIR WEISSER: Don't know. I suggest you check the daily file,  
16 Len, you have as good access to it as I do through the web.

17 MR. TRIMLETT: Okay.

18 CHAIR WEISSER: I haven't heard anything in terms of hearing  
19 action on it. Are there any further public comments? Mr.  
20 Peters?

21 MR. PETERS: This is on the legislative update?

22 CHAIR WEISSER: Yes, please.

23 MR. PETERS: Okay. The AB386 was that all interested parties  
24 that you met with or what kind of groups met on that issue?

1 MR. CARLISLE: That was consumer groups that met with Assembly  
2 Lieber's staff.

3 MR. PETERS: And with - okay, consumer groups and just yourself,  
4 or how did that work?

5 MR. CARLISLE: My self, Jude Lamare, there were a couple  
6 environmental groups, as well.

7 MR. PETERS: Anybody else, just Jude off the Committee?

8 MR. CARLISLE: Yes.

9 MR. PETERS: And nobody else off the Committee?

10 MR. CARLISLE: No.

11 MR. PETERS: Because that certainly is of interest to me, AB386  
12 and I was just curious. Thank you.

13 CHAIR WEISSER: Thank you, Mr. Peters. Any other comments,  
14 questions from the audience? Okay.

15 - o0o -

16 The next item is the draft IMRC Report. What is it that you  
17 would like us to chat about in that regard or is that just  
18 on there as a potential placeholder?

19 MR. CARLISLE: That was just a placeholder, yes.

20 - o0o -

21 CHAIR WEISSER: Then we have Report Topics and that's a  
22 placeholder.

23 MR. CARLISLE: Correct.

24 - o0o -

1 CHAIR WEISSER: Emily? Here's a choice. 25 minutes today or  
2 all the time you need next month. My advice to you would be  
3 wait until next month because I think people are flagging up  
4 here and I want folks to hear what you have to say, if  
5 that's okay. Pardon me? Emily, it's in Emeryville. Will  
6 that create any sort of problem for you, our meeting in  
7 February? Okay, great. Excuse me? Yes, we're meeting at  
8 the Emeryville City Hall. Okay, for those of you who live  
9 in Sacramento, you might want to explore taking the train.  
10 It's kind of a cool trip and it drops you off within a  
11 really hop, skip, and a jump of a cab ride. It's nice.  
12 Jude?

13 MEMBER LAMARE: Well, I very disappointed that we won't be  
14 hearing anything from Emily today. And I'm just wondering  
15 whether she brought anything in writing or if there's  
16 anything that she can give us to look at before the next  
17 meeting so we might see what - is there something in the  
18 packet?

19 MR. CARLISLE: Yes, there is. There's a presentation.

20 MEMBER LAMARE: What number is that?

21 CHAIR WEISSER: I think it's 6B.

22 MEMBER LAMARE: Thank you.

23 MR. CARLISLE: Yes, it's right after Jeffrey's.

24 CHAIR WEISSER: And I apologize, Emily, we usually are able to  
25 do everything, but today just didn't work out.

1 MR. CARLISLE: Mr. Chairman, if I might add, next month I'm  
2 going to have a van available for any Committee Member that  
3 resides locally that wants to ride over to Emeryville with  
4 us.

5 MALE: Who's driving?

6 MR. CARLISLE: I am.

7 CHAIR WEISSER: Is it padded? Okay.

8 - o0o -

9 We're now gonna move to just the general public comment  
10 period, so if there's anybody who has any general public  
11 comments, we'd like to hear them now and we'll start with  
12 Mr. Rice. Bud? This is on the Smog Check program, not on  
13 the Steelers soon-to-be triumphant victory walk over the  
14 Seattle Seahawks.

15 MR. RICE: True enough. Thank you. Bud Rice with Quality Tune-  
16 up Shops. Just in terms of a quick question for me. If the  
17 IMRC is in support of an action or a bill, or something like  
18 that, does the IMRC have some kind of a polling that's done  
19 where they - where the Chairman might say, is the IMRC in  
20 favor of this, let's second it, have you guys vote on it,  
21 and if the count ends up being, let's say - let's pretend  
22 Dennis was still here, those three guys are saying, no we  
23 don't like this and this six over here are saying yeah, we  
24 like this. Just in terms of a majority decision, six beats

1 three, so is it the opinion of the Committee that you are  
2 then in support of whatever it is you're voting on?

3 CHAIR WEISSER: We act according to Robert's Rules.

4 MR. RICE: Okay.

5 CHAIR WEISSER: And Robert's Rules provide that if there's a  
6 quorum present that a majority of those present are  
7 sufficient to pass a measure. So the answer to your  
8 question, which you wanted to be a lot simpler than what I'm  
9 making it, is yes. We do not have to have unanimity in  
10 order to take a position.

11 MR. RICE: Okay, then -

12 CHAIR WEISSER: Now, excuse me, Bud. Just to be clear, on  
13 legislation, we do vote to take a position. It's not  
14 something that I as the Chair or Rocky as the Executive  
15 Officer do on their own as much as I'd like that to be the  
16 case sometimes.

17 MR. RICE: Then just a quick follow-up. If there is some  
18 disagreement on that, and in the end the vote is taken and  
19 it is then the position of the IMRC to then back this  
20 legislation or back this whatever it is, in the same way  
21 that there is with the Supreme Court ruling, where there may  
22 be a minority point of view and a majority point of view,  
23 there isn't any provision for that, so the three that don't  
24 like it have a chance to at least get into the record their  
25 feelings about what they don't like, because the ones that

1 are in support of it do have a way of getting that into the  
2 record, because it was passed.

3 CHAIR WEISSER: Bud, we live in America. We have a free country  
4 and free speech is protected mostly. Any member of this  
5 Committee has the right as an individual to represent their  
6 views in the legislature -

7 MR. RICE: Okay.

8 CHAIR WEISSER: - at any point in time. So, whether or not the  
9 IMRC in a letter that we would write would say three people,  
10 you know believe this, two people believe that, but the  
11 majority believe this or not, any individual can make a  
12 comment to the legislature along their lines. I think we  
13 have to pick and choose when in fact on an issue it's  
14 important for us to actually note in a letter what the  
15 minority views are. I think it's a case-by-case kind of  
16 thing. Hopefully, that will occur very infrequently.

17 MR. RICE: All right. Thank you. Thank you.

18 CHAIR WEISSER: Mr. Peters?

19 MR. PETERS: Mr. Chairman and Committee, Charlie Peters, Clean  
20 Air Performance Professionals, coalition of motorists. In  
21 the discussions today, it was pointed out that on occasion  
22 it was found that inappropriate activities took place during  
23 audits, during times that cars, where they knew what was  
24 broken, they took them out to get them fixed, clean-piped  
25 and so on and so forth and the question is, did the Smog

1 Check provider every find out that he didn't do his job or  
2 he did it wrong, or was that after he got the cuffs on and  
3 was in jail? If you don't tell people that they did  
4 something wrong, then they continue to do it wrong,  
5 possibly, maybe for years before they even find out and I  
6 think that's a good question to ask. Another question is,  
7 we've heard an awful lot about these OBD II failures, but we  
8 didn't hear any comparison between what happens at the  
9 dealer when it's under warranty and what happens when it's  
10 not. I think that's a really good question for the  
11 Committee to find out if the car - if the costs are  
12 different, if it's handled different, if the effects are  
13 different in fixing the problem on the cars that are still  
14 being produced, if that - if there's a big difference there  
15 and I think you might find there to be a huge significant  
16 difference there in cost and procedures. The final issue is  
17 the issue of training and education and information. If  
18 there are no demands for performance that are real, then  
19 you're never gonna have any market for information and like  
20 it was pointed out that there are significant improvements  
21 coming down the line in aftermarket providers' information,  
22 but if in fact you set standards demanding that cars that  
23 are broken get fixed, then you're gonna create demand for  
24 information and that information is gonna be there and be  
25 provided because there's a market for it. If we're gonna

1 sit here and depend on Government to take care of everything  
2 and supply all the information, then we're likely to get  
3 just a whole lot of misinformation and lack of performance.  
4 So to solve the information problem, you create a demand,  
5 which creates a demand to get the car fixed and when the  
6 guy's gonna get the car fixed after not doing his job, he's  
7 gonna get it fixed and that demand for information is gonna  
8 be there and you will make a huge difference in the  
9 availability of information provided by the competitive  
10 marketplace which will be quick and cheap and accurate and  
11 get the job done. When we're gonna go, Mr. CARB, please  
12 bless us with all the information so we got an excuse when  
13 we do it wrong, he ain't never gonna get the public served  
14 and the air cleaned up in California. Thank you.

15 CHAIR WEISSER: Thank you, Mr. Peters. Mike, with a simple yes  
16 or no, were the folks that were practicing malfeasance  
17 alerted to their - the error of their ways?

18 MR. MCCARTHY: In one case, yes, because I went and talked to  
19 the person directly, to point out because it was a tough  
20 diagnosis, the actual diagnosis, and I wanted to point out  
21 why he might have overlooked it. In the other cases no, I  
22 have not turned the information over to BAR.

23 CHAIR WEISSER: Including the clean-piping one?

24 MR. MCCARTHY: Including the clean-piping one because we were in  
25 a weird situation where we were recruiting from stations and

1       then taking them to different stations undercover and we  
2       were trying to maintain some participation in the program  
3       without letting others know or let the word get out that ARB  
4       is out there doing enforcement and be suspicious of every  
5       car that comes in. So we -

6 CHAIR WEISSER: I don't want to hear anything more. Are there  
7       any other folks that would care to share questions?  
8       Committee Members, anything further anyone wants to raise on  
9       any subject?

10 MALE: Just a quick one. I agree with Charlie 100 percent on  
11       the training thing, but I just want to submit one more  
12       thing. I advanced the idea that all of the training is  
13       available. The problem is motivating technicians to go take  
14       advantage of it.

15 CHAIR WEISSER: Yeah. Ladies and gentlemen, with great  
16       forbearance to Emily Wimberger for allowing us to forego her  
17       presentation today, placing it on the Agenda for the first  
18       thing after the Executive Officer's Report at our next  
19       meeting, I will now, by adjourning this meeting, bid you all  
20       a fond adieu until February. The meeting's adjourned.

21                   **- MEETING ADJOURNED -**

22                   - o0o -

TRANSCRIBER'S CERTIFICATION

This is to certify that I, TERRI O'BRIEN, transcribed the tape-recorded public hearing of the Bureau of Automotive Repair dated January 24, 2006; that the pages numbered 1 through 209 constitute said transcript; that the same is a complete and accurate transcription of the aforesaid to the best of my ability.

Dated February 2, 2006.
